ABOUT ORBEA

ORIGINS, PROCESS.

ORBEA BICYCLES

NEW RANGE OF PRODUCTS.

EQUIPMENT

HELMETS, APPAREL AND HYDRA.

YESTERDAY, TODAY AND TOMORROW

Since its inception, more than 170 years ago, Orbea has been associated with indefatigable quest, adaptation and self-improvement. These traits have brought us to where we are now, earning us international renown and presence in more than 65 countries.

This could only be possible with the joint efforts and trust of the people who make Orbea, and with a series of values that have created unity, strength and capability.

Our catalog reflects this, as a tool where we share our personality, our know-how and solutions — a tool that shows our love of sports and our eagerness to be what we imagined we could be. This catalog reflects our passion in providing innovative global solutions and lifetime warranty as proof that we know we're offering top-quality products.

At Orbea we create experiences for you to feel, enjoy, discover and do better. But, above all, we want to be by your side, experiencing with you and meeting your needs in order to improve and always give you the best.

JON FERNÁNDEZ. Orbea General Manager.

COMPANY HISTORY

COMPANY HISTORY

The Orbea family in Eibar, nineteenth century.

ORIGINS

Orbea was established in 1840 as a family-run company making revolvers, cartridge guns and pistols. With the outbreak of World War I, the company experienced growth. When the war ended, the firm changed business, focusing on the manufacture of precision mechanics-based products: prams, school desks and, finally, bicycles, producing as many as 50,000 a year.

A few years later, the economic crisis brought Orbea to the brink of bankruptcy. This would've meant doing away with the firm and with the jobs of 1,500 families. Showing once again that they weren't ready to give up, the workers talked the owner into transferring the plant to them. The company became a cooperative, joining the Mondragon Cooperative Group in 1971. This way, they managed to keep their jobs and a brand with an already long history.

In 1975, the company moved its headquarters to their current location in Mallabia. At the new facilities, Orbea entertained the idea to have a professional elite cycling team, whose future members would include Perico Delgado — winner of the Vuelta a España 1985 — or Marino Lejarreta. Although Orbea has always been associated with racing, it was only in 1982 that it became the sponsor of a road cycling team.

Later, with the emergence of mountain biking, Orbea launched an initiative that would change the brand and the industry for good: its first MTB team, led by Jokin Mujika, who won the Spanish Cyclo-Cross Championships in 1994.

With time, Orbea embarked on internationalization, going beyond exclusive sales in Spain, first with exports to France and then with branches in USA, France, Italy, UK, Belgium, Germany, Australia and Portugal. The internationalization strategy was divided into three areas: products, markets and brand. At present, Orbea operates in more than 65 countries, developing and supplying around 250,000 bicycles, thousands of helmets, cycling wear and hydration packs, and planning trips and events.

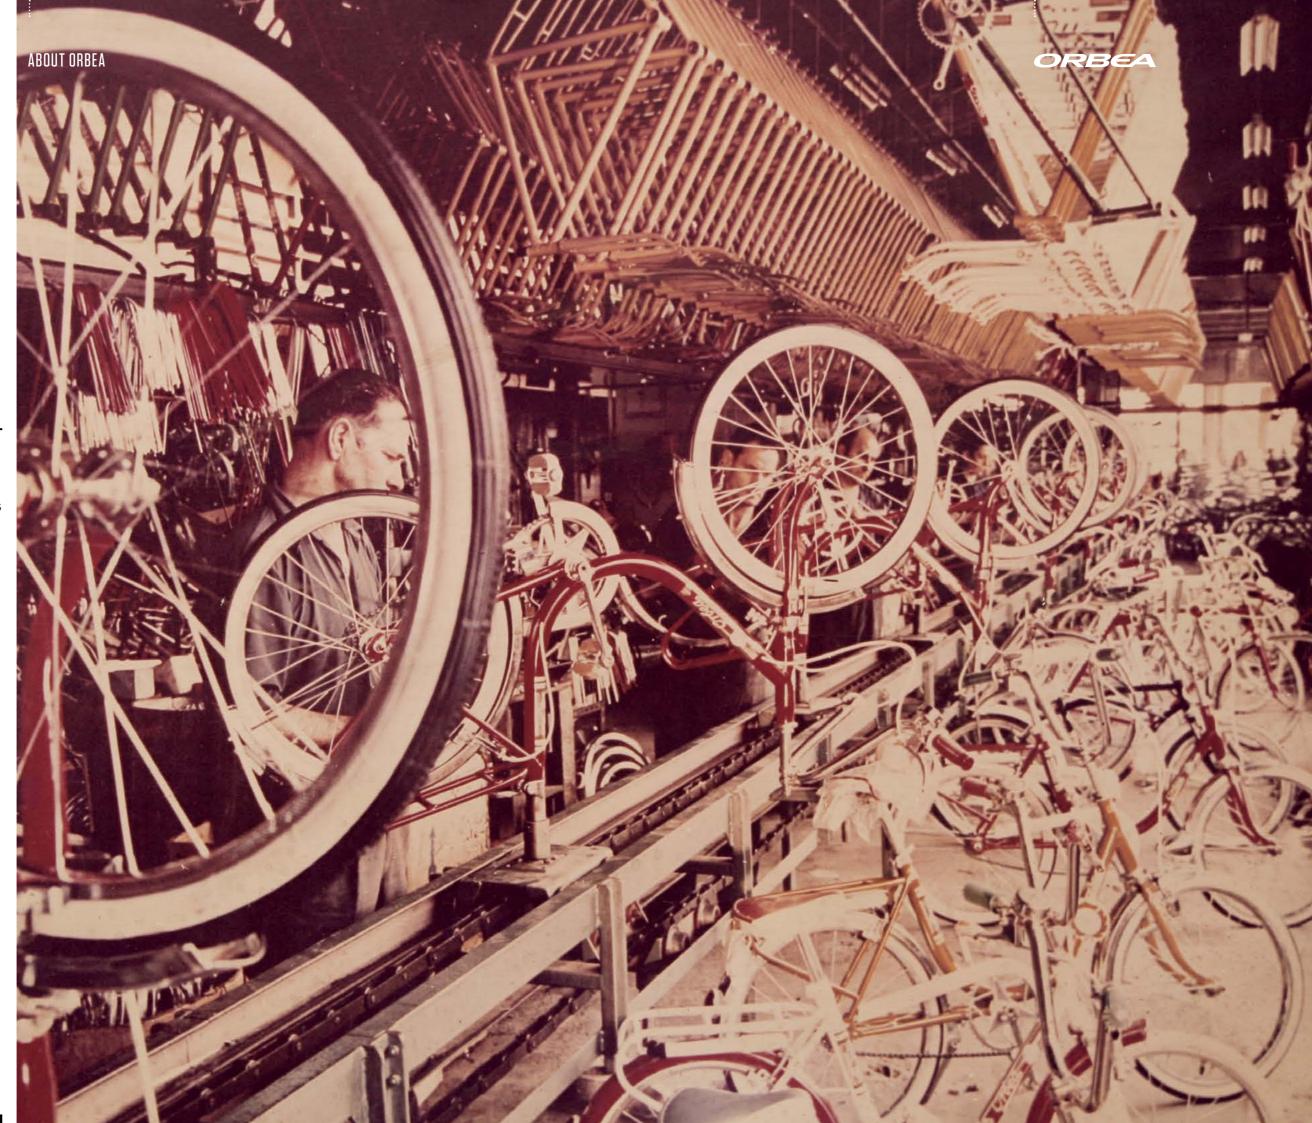

Since the making of its first bike, Orbea has managed to adapt to the course of history, offering quality products with ever-changing, innovative designs and materials

Since the creation of its first revolver, Orbea has evolved with the times. The constant renewal of products and services led to the birth of Orca, the brand's flagship range, in 2003.

Orca was Orbea's first carbon fiber bicycle. With it, a new era began, not only for the firm but also for the most demanding road cyclists. The Orca combines state-of-the-art technology with innovation and design. The Orca's first victory came with Iban Mayo, who won the queen stage of the Tour de France in Alpe d'Huez riding it. Then, the bicycle won the Eurobike Award, as well as several stages of the Giro d'Italia, the Vuelta a España and lots of races around the world. Without a doubt, the Orca paved the way for success. Today, Orbea is as passionate and enthusiastic as when it first hit the road.

Continuous innovation and development have earned the brand great accolades, like Julien Absalon and Samuel Sánchez's Olympic gold medals in Beijing (MTB and road cycling, respectively) or the Ordu as the fastest triathlon bike in history between the legs of Orbea Orca Tri Team Member Andrew Starykowicz and, before that, Craig Alexander's Ironman Hawaii victories in 2008 and 2009.

This has placed Orbea among the world's leading and most prestigious bike makers. Throughout the years, the brand transformed itself and grew, based on an undeniably successful strategy.

0

Orbea riders, 1931.

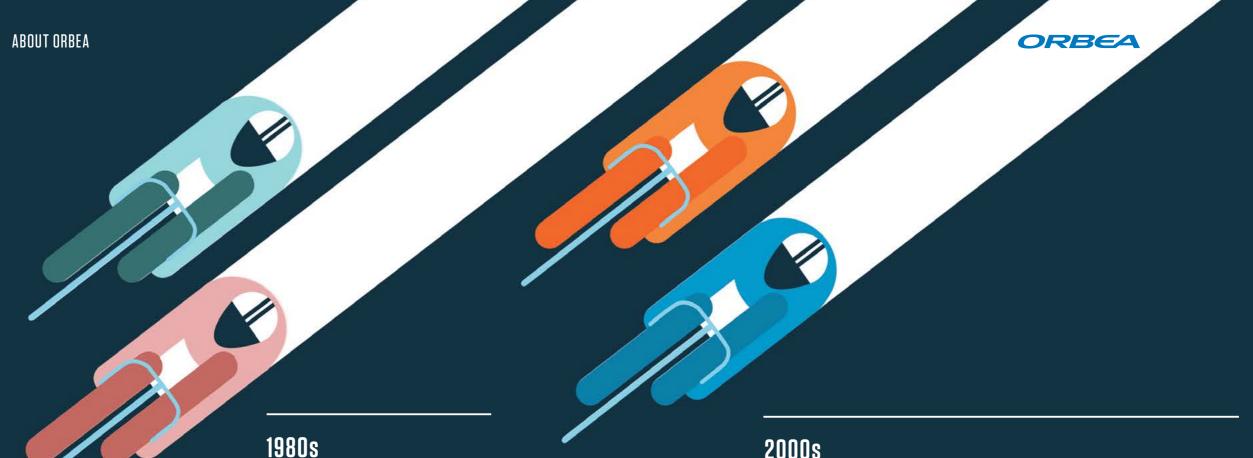

GREAT CYCLISTS

The Orbea cyclists have contributed to the grandeur of a sport in which difficulties, effort and self-improvement go hand in hand. They contributed to lay the foundations of modern cycling and became the idols of thousands of fans, both children and grown-ups, handing out badges with their favorite riders' faces. Cycling is a sport that puts your heart and mind to the test. In the past, resources were more precarious than they are now: wheels that were inadequate for specific terrains, cycling wear that got too heavy when wet, makeshift feeding stations, troughs to shake the mud off contributed by generous fans...

Commitment and passion were indeed necessary in those early cyclists, men who pedaled hard for their sport to grow. In its early years, cycling was less a sport than an endurance test.

They've been our most loyal users, relying on our brand philosophy and quality. They've supported and encouraged us in our development, always choosing our products. Their lifestyle has changed throughout the years, and so has ours. There came a time when they were no longer happy with just one sport, and so they embraced diversity: challenge,

competition, self-improvement. Today, they demand products that deliver unforgettable and unique experiences. They've inspired us, challenged us, moved us to do better, and this makes them the cornerstone of our business.

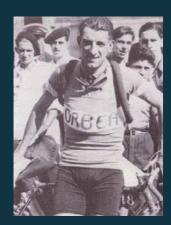

1930s

The Montero Brothers

The surname 'Montero' is associated with the oldest family saga in Spanish cycling. Born in Ávila and raised in Gipuzkoa, the Montero brothers had cycling written in their hearts as children. Ricardo and Luciano, who was six years younger, were both powerful and able cyclists. As members of Real Unión Orbea, they clinched many victories: Circuit de Mainsin, Gran Prueba Eibarresa, Dax, Irún, Luarca, and many others.

Federico Ezquerra

Bizkaia-born Federico Ezquerra was the first great Basque cyclist. He got as many as 87 victories in 19 seasons, 17 of them with the Orbea team. An outstanding climber, Ezquerra was an Orbea rider from 1934 to 1936, winning small but prestigious races that earned him a place among the big names of world cycling. His most accomplished victory was the Nice-Cannes stage of the Tour de France, on the outbreak of the Spanish Civil

1960s-1970s

Miguel María Lasa aka "LAPA"

Lasa joined the Orbea team in 1971. During his cycling career, he won 76 races, including six stages in the Vuelta a España, three in the Giro d'Italia and two in the with the Orbea team.

Tour de France. He also got many awards

Perico Delgado

the Tour de France.

Pedro Ruiz Cabestany

Delgado rode with Seat-Orbea in 1985, earning the brand two of its milestones: the overall victory in the Vuelta a España and and the queen stage of the Tour de France, finishing in Luz Ardiden, in the Pyrénées, beating all rivals with the help of teammate Peio Ruiz Cabestany.

Born in the Basque Country to a Catalan

family, Cabestany was a pro from 1984

to 1994, winning 23 races. From 1984

1990s (MTB)

Jokin Mujika

Mujika took his first steps as a pro with Orbea, after having trained with the team as an amateur rider. In 1988, he won the Euskal Bizikleta (with the climb to Arrate). Then this race became the Tour of the Basque Country. He took part in all three grand tours from 1984 to 1989, always riding an Orbea bike and being part of the Orbea team: Orbea, MG-Orbea, Seat Orbea, Caja Rural-Orbea In 1993, Mujika took up cyclo-cross to great results. In the last part of his career he embraced the recently born MTB, participating in this discipline in the Atlanta Olympic Games in 1996, when he was 22nd.

2000s

Roberto Laiseka

When he became a pro in 1994, Laiseka began to wear the shirt of Euskadi (later Euskaltel-Euskadi). In his 30s he stood out as a climber, winning races in the Vuelta a España and the Tour de France. In the former he clinched victory in Luz Ardiden, like Perico Delgado before him and Samuel Sánchez ten years later. He retired in 2007, having been injured in the Giro d'Italia the year before.

Julien Absalon

Julien Absalon was the king of XC in the past few years. With his inseparable companion, the Orbea Alma, he took four World Championships, five World Cups and Olympic gold in Beijing. As a member of Orbea Racing Team from 2006 to 2012, Absalon dominated the French MTB and cyclo-cross scene.

Iñaki Leiarreta

World Junior champion, Olympic diploma in Beijing, Spanish Elite and U23 champion, winner of countless races at the MTB Spanish Open, a member of Orbea Racing Team since it was formed, alongside Rubén Ruzafa, Julien Absalon and other leading bikers, a cyclo-cross enthusiast and, above all, a lover of sports, lñaki had his life taken away in a road accident when he was training. Lejarreta was a fighter, a man who stood up for care and respect when riding or driving on the road until the end of his life. To Orbea, Iñaki set an example. He was a hero.

BRAND HISTORY

Evolution is wired in Orbea's DNA. It's part of our philosophy and our being. To Orbea, life means nothing without the search for new, better ideas, without new technologies to improve our products and their usability, without moving forward, without taking further steps. This is what we think, as reflected in our character and brand, adapting to change, time and users along the way to make an internationally renowned and strong brand.

1840-1900

Orbea started off as 'Orbea Hermanos', a small gun factory in Eibar. It soon became one of the leading companies at the local level, and a big player in the national industry. With time, it expanded business to cartridges, mother-of-pearl grips and machinery. Always in the avant-garde of progress, Orbea was the first plant in Eibar to use electric power.

1900-1930

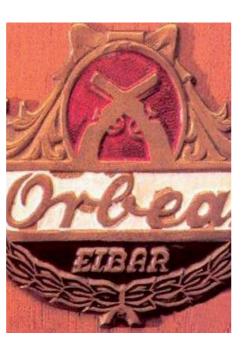

As early as 1907, Orbea embarked on internationalization, setting up a plant in Buenos Aires. With the new plant, and the outbreak of World War I, production grew exponentially, and this led to the opening of new facilities and the creation of jobs. When the war was over, Orbea extended its range of products, focusing on the manufacture of bicycles and gradually exiting the gun industry.

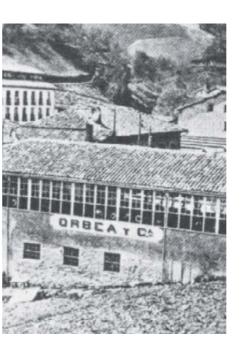

1930-1950

After the Spanish Civil War, the Orbea plant had 1,000 workers, producing 50,000 bikes a year. This kind of success, however, was not enough. Orbea's thirst for innovation led to investment in new sectors that were all the rage in other parts of the world. In 1944, it took its first steps in the automotive industry with Electrociclos S.A., releasing an electric motorcycle and two carrier tricycles with the box at the front. At the same time, Orbea had its first sponsored pro cyclists, bearing fruit in accomplishments like Mariano Cañardo's second place in the Vuelta a España 1935.

1950-1969

In the 1960s, Orbea renewed its commitment to innovation, producing the Velosolex scooters. However, shrinking demand for bicycles in the domestic market resulted in one of the worst times in the company's history.

1969-1975

In the early 1970s, the workers took charge and set up the Orbea Cooperative. Later, Orbea joined Mondragon, the world's largest cooperative group.

1980-1990

In these decades, Orbea sponsored professional cycling teams like Grupo Deportivo Orbea-Danena. In 1985, Perico Delgado won the Vuelta a España riding an Orbea bicycle and using Orbea gear. Also in this period, Orbea entered the MTB cycling market.

1992

In the early 1990s, Orbea put together its first MTB team, led by Jokin Mujika, who won the Spanish Cyclo-Cross Championships in 1994.

1997

In 1997, Orbea redesigned its strategy so as to be able to operate in the global market. The company began to open up to new markets while focusing on product R&D and building a strong brand image according to the new times and types of users.

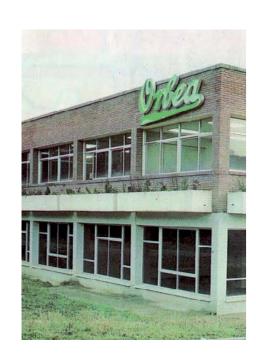

2003

In 2003, Orbea produced its first carbon fiber bicycle, the Orbea Orca Carbon. The Orca combined state-of-the-art technology with innovation and design. The Orca won its first race with Iban Mayo. It was the queen stage of the Tour de France. Then there came other prizes, like the Eurobike Award.

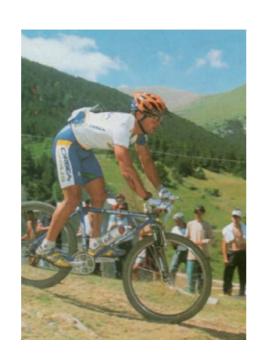

2008

Continuous innovation and development earned the brand great accolades, like Julien Absalon and Samuel Sánchez's Olympic gold medals in Beijing (MTB and road cycling, respectively) or the Ordu as the fastest triathlon bike in history between the legs of Orbea Orca Tri Team Andrew Starykowicz. Before that, there were Craig Alexander's Ironman Hawaii victories in 2008 and 2009.

But things didn't stop there...

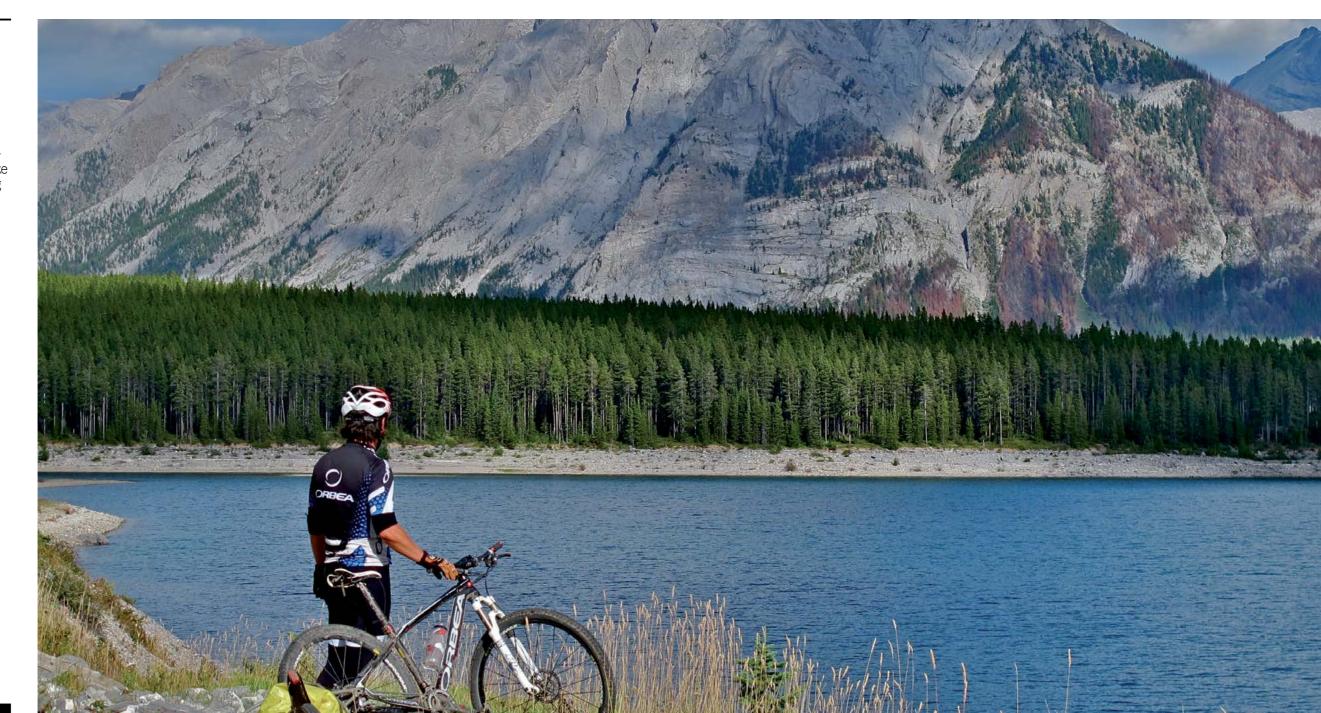

ORBEA TODAY

Orbea is now a well-established, internationally renowned brand that has undergone a dramatic transformation and significant growth in the past few years. The brand has been saluted for its capacity to introduce new proposals and make changes leading to a new understanding of the bike industry.

ORBEA TODAY video.

WE ARE ORBEA

WE ARE ORBEA

OUR VALUES

Our values mark the way on the basis of tradition, although with an innovative concept and structure. Our values are related to the way we understand everyday work, the way we live, and the way we feel, experience and approach sports. Guided by our values, we can face the development of the global solutions we offer users a wide range of products for leisure and sports carrying the best of us.

1. STYLE

Orbea is style, as can be appreciated in product design, in the introduction of innovative solutions and in the avant-garde technology used.

The Orbea style can be seen in our points of sale and packaging. The Orbea style shows on our website and ads. Orbea is a lifestyle for active people.

2. SPORT

Orbea will always be sport.

No matter whether it's cycling, mountaineering, skiing or canoeing. Orbea will always be the companion of users who turn sport into a lifestyle.

Orbea is a teacher rather than a seller. We encourage and boost multi-sport events as the road to personal growth.

Orbea guides you.

Orbea is with you. Orbea teaches you how to do it, and how to do it better.

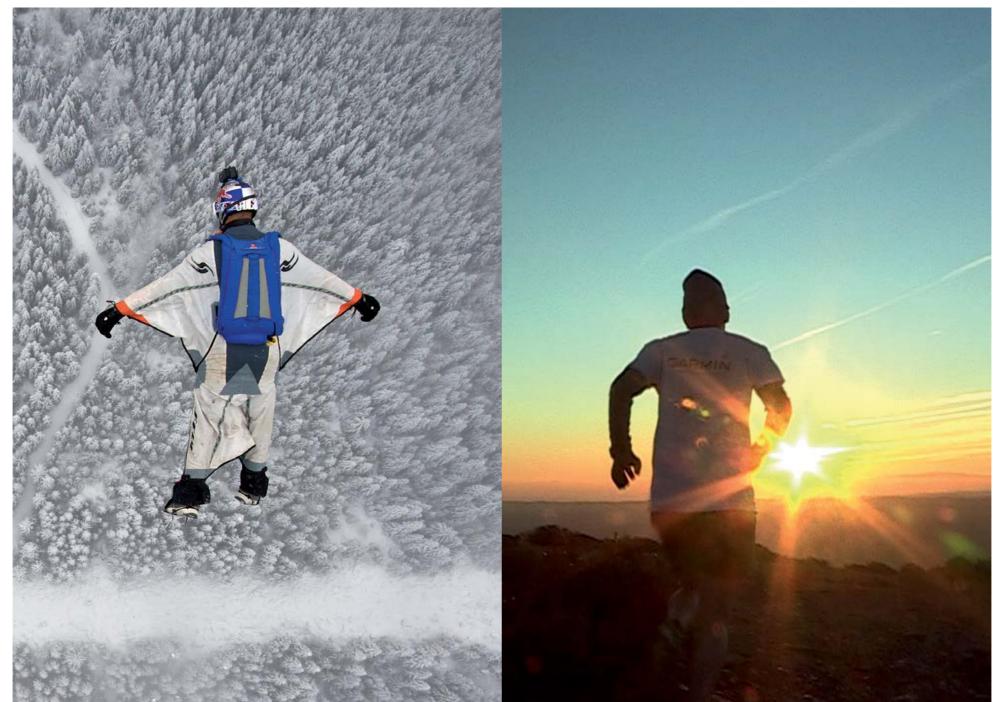

3. ESCAPE

Orbea is escape because it helps you get away from routine.
Because our product solutions help you break away from weekly schedules and city rhythms.

Because you can share things with other Orbea users in our groups and commu-

Because you can go as far as you want. Because Orbea is joy and leisure.

4. FREEDOM

Orbea is a brand of freedom.
A brand that develops outdoors and offers solutions for users to do sports at the level they choose.
Orbea is freedom to choose what you want to be

want to be.

Orbea is free because it's independent; it's the result of what we've chosen to be.

WHAT DOES IT MEAN TO BE ORBEA TODAY?

Our values stem from feelings we experience at Orbea every day. Feelings we believe in. Feelings we fight for. Our principles are a full statement of what it means to be Orbea today. We're ambitious, we love to learn, to expand, to compete, to be free, to be international, to change for the better all the time, to keep abreast of the latest trends and technologies and, above all, to deliver guaranteed products.

1. THINKING THAT A FAILURE YOU CAN LEARN FROM IS MORE VALUABLE THAN SUCCESS WITHOUT A LESSON. 2. THINKING THAT IF YOU DON'T TAKE RISKS AND FACE CHALLENGES, YOU ALWAYS LOSE. 3. THINKING THAT A CUSTOMER IS A PERSON CLOSE TO US. 4. BELIEVING THAT COMPANIES SHOULD GIVE BACK TO SOCIETY AT LEAST WHAT THEY'VE GOT FROM IT. 5. BELIEVING THAT IMAGINATION IS THE BASIS FOR INNOVATION. 6. REMEMBERING THAT ALL OPINIONS ARE VALUABLE. 7. KNOWING THAT YOU HAVE TO KEEP RUNNING AFTER CROSSING THE FINISH LINE. 8. UNDERSTANDING THAT THE SEEDBED OF CREATIVITY IS ORGANIZED CHAOS. 9. THINKING THAT THE IDEA THAT SOMETHING IS IMPOSSIBLE IS AN OPINION RATHER THAN A FACT. 10. BEING SURE THAT BEING AHEAD OF THE PACK IS BETTER THAN LAGGING BEHIND.

ORBEA 2014 ABOUT ORBEA

OUR COMMITMENT

We want to continue to grow and develop the Orbea brand at the European level and as a global reference in the provision of services and solutions to end users who like outdoor activities and all things related to bicycles.

We want to be perceived by our clients, and end-users, as a company that solves their problems and caters to their recreational and sports activities, and as a social leader embodying a series of values and feelings they feel identified with.

We want to cement alliances with local dealers and other partners joining the Orbea project and sharing our vision.

For we believe it is the people who make the brand.

Mongolia Bike Challenge.

We are a cooperative

Ever since it became a cooperative, Orbea has been linked to the Mondragon Group in its various stages.

Mondragon is a cluster of cooperatives making a second-grade cooperative. This means every single cooperative can grow to a degree that would be unthinkable if they were on their own, reaching places they'd never be able to reach alone. More than 80,000 people work at Mondragon Corporation around the world, and 9,000 are studying at the Corporation's universities and learning centers. This means huge revenues and the right resources to face the future.

Being together also means making progress in fulfilling the values that both Mondragon and Orbea are staunchly committed to.

Our highest goal is to transform society with freedom, justice and solidarity. This is why we're committed to values like sharing our profits with those in need, choosing labor over capital and not the other way about, or reinvesting most of our profits to create new jobs.

These are the values Orbea is committed to. The values we work and live by.

DESIGN AND PRODUCTION

Orbea was established almost 170 years ago and has been designing bikes for more than 80. Since then, we've experienced many different changes in terms of design, materials and product technology: carbon, manufacturing processes, painting, testing, and so on.

And we've gone down this road with hope and passion for sports and their history. We want every bicycle to be special and unique for the person riding it.

ABOUT ORBEA

Lifetime warranty

Orbea offers lifetime warranty on all bicycle frames. Only a manufacturer with a knowledge of materials, a command of technology and with the right skills can guarantee that your frame is an indestructible weapon. Only Orbea can take you one step ahead.

Thanks to monocoque construction, we can make sure that your frame will be flawless. And, if you happen to get a faulty frame, we take responsibility for it. Orbea frames are the result of a long process involving design, manufacturing and quality tests.

Our efforts to get maximum quality in bikes enable us to offer a warranty nobody else can give you. No other market player can offer the security we give you.

The Orbea warranty certifies you'll always have a healthy bike frame. To activate it, you must use the registration number you'll find in all Orbea frames. Once you activate your warranty with your retailer or online at www.orbea.com, your frame will be protected forever.

Additional benefits include the possibility to report losses, enter competitions or learn the world's latest news.

Orbea Design

Orbea Design revolves around four elements we believe to be key in bike design:

WE LOVE BIKES

We're not bicycle-making machines. We're people listening to you and making products that meet your needs.

WE'RE FAMILIAR WITH TECHNOLOGY We want to make life easier for you. This is why we innovate, we develop solutions to offer lifetime guaranteed products. We apply technology to life.

WE'RE CREATORS

We have the capacity to build the things we imagine.

Our bikes are a fine example of this. We make them facing the greatest challenge: to offer you the best every single day.

WE'RE TREND SETTERS

Buying an Orbea bike is quite an experience. You know you're getting a companion that will never grow old or become old-fashioned, for we're ahead of the curve.

MULTI-LOCATION AS A LOCAL GROWTH STRATEGY

Given our commitment to giving back to society more than we've got from it and to creating jobs at the local level, at Orbea we chose multi-location as the most adequate strategy. Delocalization, on the other hand, is rejected as a selfish strategy.

Orbea has opened manufacturing plants in China and Portugal, logistics, distribution and industrialization offices in Hong Kong, business offices in several European, and branches in USA and Australia. The goal is always the same: local development and wealth.

As we set up our facilities abroad, we redesigned our local structure, adding valueadded jobs and turning our headquarters in Mallabia into a powerful R&D+i center, the global logistic coordination hub, the place where our value-added products are assembled and the office where strategic brand decisions are made.

ORBEA VALUES

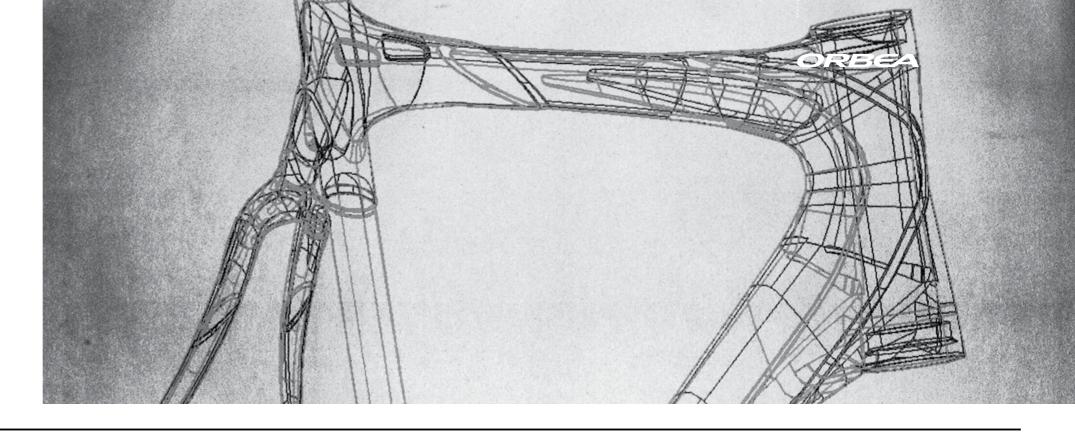

Lifetime Warranty
Orbea Design

"I have spent 10 years riding and winning with the Orca. With this bike I won my first stage at Montjuic Hill in 2004. Since then I have taken this bike around the world, and I have seen the podium and won some of the most important stages of grand tours such as Giro de Italia, Tour de France and the Vuelta a Espana. This bike has fought in the classics with Euskaltel-Euskadi and me. The bike has been dipped in Gold at the 2008 Beijing Olympics. The Orca was the perfect tool to help me win Gold in the Olympic road race. Keep Dreaming."

SAMUEL SÁNCHEZ Rider of Euskaltel-Euskadi.

HISTORY

2003 THE LEGEND WAS BORN.

Orca has always been a revolution for Orbea and for the market. It still is. It was Orbea's first full carbon fiber bike. In 2003, its creation marked a turning point in the cycling world. And it was the first step on a path of success that Orbea continues along today, with all of the passion of the early days. Bike of the year in Spain and France.

- 100% T700S Carbon Fiber.
- 1,000 gr Light Weight.
 Optimized Carbon Fiber layup to deliver better power transmission with maximum rider comfort.

2006 EUROBIKE AWARD.

We put our faith in design, setting trends for the industry. The 2006 Orca won the prestigious Eurobike Design Award, a prize it grants each year to the very best.

- Monocoque frame.
- SSN- Size Specific Nerve.
- Optimal balance between stiffness and lightness.
- Innovative frame shapes.

2008 **OLYMPIC GOLD MEDAL** IN BEIJING.

In 2008, Orbea designed the market's first ever super-lightweight magnesium seatpost clamp. Just one more step in the evolution of the bike that marked a generation.

- Monocoque Frame.
- SSN- Size Specific Nerve.
- Optimal Balance Between Stiffness and Lightness.
- Magnesium Seatpost Clamp.

2010 A NEW EVOLUTION.

The Orca evolution continues with the latest-generation Orbea Gold level carbon fiber, BB30, 1-1/8 to 1-1/2" tapered head tube, and bold new graphics.

- Monocoque frame.
- SSN- Size Specific Nerve.
- Oversize headtube.
- BB30.

2011 IT IS COMPETITION.

The Orca is our flagship road racing frame, and it is made with our top-level Orbea carbon fiber for maximum performance while ensuring an inspired, dynamic ride quality. It's not simply a product we make, it embodies the passion we feel for the top echelon of road racing. It is the adrenaline of the Tour converted into carbon, the sweat of the Giro transformed into technology, the tension of the Vuelta as innovation... it is competition.

- Monocoque frame. SSN- Size Specific Nerve.
- Attraction.
- AiZone.
- Attraction.
- AiZone.

TOMORROW... **10 YEARS ON TOP** KEEP DREAMING.

USERS

ASSOCIATED TEAMS

PRO USER.

Professional cyclists are those who are passionate about competition. They are authentic athletes who love high level competition and challenges. Our Orbea athletes are key ambassadors for our bikes and an important source of feedback in our design process. They are the people who push our road bikes to the limit.

They may ride 8000-17000 km per year. For them it is not a product, it is a tool that they use every day to achieve their best performance. They love technology and the latest innovations.

ENTHUSIAST USER.

Lovers and fans of road cycling, those who ride 3000-8000 km per year. They like riding outdoors for long stretches. They are cyclists with high purchasing power, who demand high-end products. The Orbea Orca is the bike that ensures maximum performance and a dynamic, personalized experience for the user. It is a high-tech product built to perform in the most difficult tours and races.

EUSKALTEL-EUSKADI.

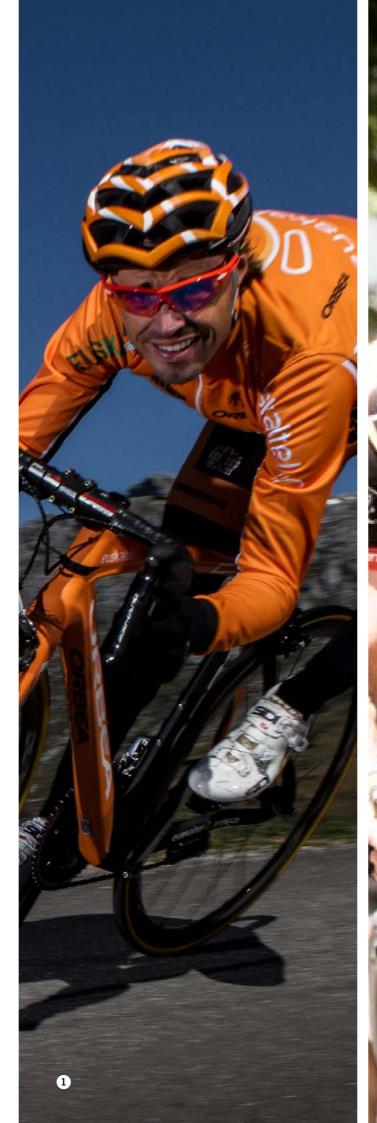

Effort, commitment and responsibility. These are the values of the Euskaltel Euskadi team. A team lead by honesty and work as ambassadors of their country. The Basque country prides themselves in supporting their home team. Euskaltel Euskadi is competitive and global. Euskaltel Euskadi are mostly riders from the Basque country and help develop up and coming riders from their country. This philosophy has driven the team for the last two decades, and given the team success that guarantees the stability of the project. Euskaltel Euskadi is a staple in the World Pro Tour peloton.

OPTUM PRO CYCLING.

The Optum presented by Kelly Benefit Strategies Pro Cycling Team continues the rich cycling tradition established by Kelly Benefit Strategies in 2007. The team enters its 2nd season under the helm of title sponsor Optum and continues to pursue winning at the highest levels of the sport while staying true to the values of its partners. Since becoming the first-ever freshman team to win the USPRO Criterium Championship, the team has consistently impressed and improved on its performances from year to year, which now also boasts the 2012 National Racing Calendar's best women's team as well as a cyclocross program.

CONCEPT

FEATURES

"Stack and reach are important measurements because they define the spatial relationships of two important touch points between your body and the bike pedals and handlebars."

10 YEARS ON TOP KEEP DREAMING.

The Orbea Orca is able to meet the needs of the most demanding users, including our professional riders. With an intense and passionate team of designers and engineers, the Orca has never been anything less the best. Any rider, any road, any distance. The Orca is for the rider that demands the very best.

TECHNOLOGY.

1. FIT

Stack and Reach

The 2014 Orbea road bikes have a redesigned geometry that allows any rider to be fit easily and properly on the bike. We based our frame sizing on the concept of stack and reach, developed by Dan Empfield, a pioneer in understanding the height and length of bicycle frames. Stack and reach are important measurements because they define the spatial relationships of two important touch points between your body and the bike – pedals and handlebars. Stack is the vertical distance from the center of the bottom bracket to the top of the headtube at center. Reach is the horizontal distance from the center of the bottom bracket to that same point - the top of the headtube at center.

An understanding of stack and reach can explain why many small bikes don't fit well. There are instances in our market when the smallest sizes do not offer shorter reach measurements and do not bring the head tube (therefore the handlebars) any closer to the rider than the next bigger size. In actuality, the way the bike fits is quite similar to the next bigger size save for a typically shorter stack on the smaller size. How does the manufacturer advertise a full size range then, based on top tube lengths? Changes in seat angle have historically been the answer. For a given reach, a steeper seat tube angle will result in a shorter top tube length. This old way

of looking at sizing based on the top tube measurement can ultimately be deceiving. Reach, on the other hand, is a measurement that is unaffected by angular differences in seat tube geometry.

What we're suggesting is an evolution in bike geometry. It's a different way to look at how to design and build bike frames that allows the Orca sizing to follow a more linear size progression. We've also increased the number of sizes to seven, up from six last year. The goal was to have a bike that can fit riders of all sizes. Our unique stack and reach based geometry means easier size selection and ensures an actual progression in sizing and fit, from the smallest size to the largest.

Our new road range will span two distinct geometry patterns that allow us to offer different fit styles. These differences address the needs and wants of all cyclists, man or woman, large or small. At Orbea, we know that everyone is different, with different bodily proportions, ranges of flexibility, and intended riding preferences and styles. We are all cyclists, yet we are all individuals. This is why we're building road bikes with options - to get you fit first and riding comfortably in the end.

Of the two geometries, the farther reach / lower stack of the Orca yields a shorter head tube and a lower, more forward hand position. The Orca is the bike that our professional riders on the Euskaltel-Euskadi and Optum Pro Cycling teams choose for their battles on roads around the world. It is a perfect bike for riders with good flexibility and who desire the

ability to have the most aerodynamic body position for supreme performance.

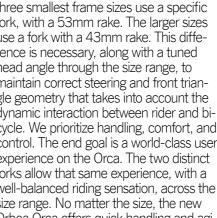

Linear size progression

We've developed seven new sizes for the new Orbea Orca, up from six on the previous generation. The new size range includes 47, 49, 51, 53, 55, 57, and 60cm sizes. This large range of sizes ensures that anyone can ride an Orca, no matter how large or small.

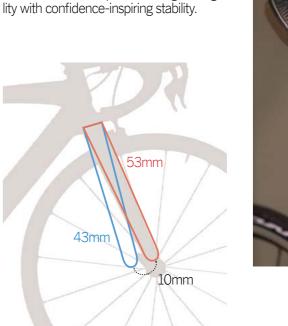

After analyzing our historical fit data, we concluded that we could greatly improve the fit options for our smallest riders. We are now offering new 47 and 49cm sizes. And since the Avant follows a more linear size progression, with regards to stack and reach, the 47cm bike indeed offers the smallest fit, with each subsequent size getting larger in a logical and predictable

To make these new bikes a reality, we've built two distinct forks for the Orca. The three smallest frame sizes use a specific fork, with a 53mm rake. The larger sizes use a fork with a 43mm rake. This difference is necessary, along with a tuned head angle through the size range, to maintain correct steering and front triangle geometry that takes into account the dynamic interaction between rider and bicycle. We prioritize handling, comfort, and control. The end goal is a world-class user experience on the Orca. The two distinct forks allow that same experience, with a well-balanced riding sensation, across the size range. No matter the size, the new Orbea Orca offers quick handling and agi-

Monolink

Monolink Wide range of adjustment a total of four degrees of fore and aft adjustment from the base 73° seat tube angle. This makes the total effective range from 71° to 75°. Each Monolink equipped Orbea Orca comes with a dual-rail adapter set for the seatpost. Only available on the Orbea Orca Euskaltel-Euskadi Team Edition.

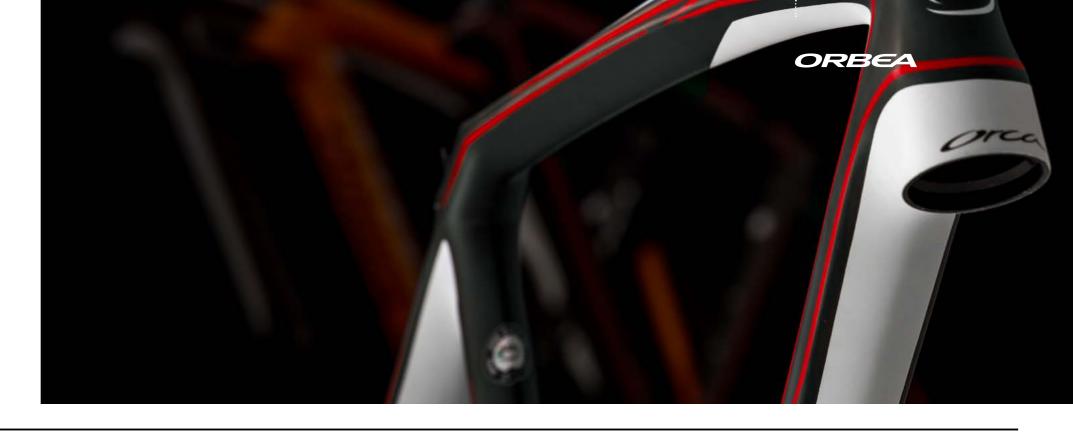

ORBEA 2014 / BIKES / ROAD / ORCA

CONCEPT AND FEATURES

FEATURES

2. AERODYNAMICS

In our latest version of the Orbea Orca, we have pushed for an optimum blend of attributes to create a bike that is perfectly balanced for the rigors of competition. One of our goals was to reduce wind resistance without sacrificing the stiffness or efficiency of the Orca frameset. And armed with our recent experiences in developing the latest Ordu superbike, we have re-designed the Orca fork. It was an obvious place to look for a speed advantage. The new fork make our bikes faster and more stable, giving the user an ability to ride at higher speeds with less energy expenditure.

The new Orca fork has a 1:3 aspect ratio. More importantly, it is only 1cm wide the minimum limit set forth by the UCI technical guidelines. We've designed it for maximum reduction of aerodynamic drag at the front of the bike, precisely where these gains matter the most. Along with the narrowing of the fork blades, our engineers completely re-designed the layup schedule for the monocoque construction to ensure no reduction of strength and stiffness. The result is an Orca fork that complements the frame for confidence inspiring handling through high-speed corners, yet it is 7 watts more efficient than the last version.

3. CONSTRUCTION

Monocoque

Orbea carbon fiber bicycles are made with a monocoque construction technique. This translates into a bike frame structure made as one seamless unit. We've been doing it this way since 2002, and our experience tells us that this is the only way to produce frames with the strength and durability to be worthy of our lifetime warranty.

Monocoque isn't the easiest way to build bike frames, nor is it the least expensive. However we choose to use this process because it offers us the ability to produce the best bikes on the market, and we won't compromise our standards to save a little money on manufacturing costs.

Part of the complexity of monocoque is the requirement of a dedicated mold set for each size frame. However, we can guarantee consistency and accuracy with the molding process, and monocoque allows us the freedom to create complex and beautiful tube shapes. This method of building the frame as one structural unit also allows the placement of continuous fibers that run through tube intersections in the frameset. The long fibers transmit forces throughout the tubes to reduce the chance for frame failure at critical, high stress areas.

Each frame size bears a specific design, optimizing the performance of the frame structure according to the size and body mass of the intended rider. The result

is seven individually designed frames 100% exclusive and perfectly balanced. We achieve this by creating carbon fiber frame structures with optimized tube diameters, wall thicknesses, and lay-up schedules, each variable being specific to a particular frame size.

This is a quality standard that we guarantee on our products, and which is far above the average standard required.

The result of this painstaking attention to size-specific design is that the new Orbea Orca will provide similar ride quality and performance characteristics across the size range.

The new Orbea Orca range is 10% lighter than and 8% stiffer.

Attraction

Attraction is the smoothness that all cyclists desire. It insulates you from the realities of the road surface. This allows you to ride at peak performance, have more control, and benefit from more traction at all times. When you hit bumps, the compressive forces are converted into shear movement in the distinctive twists and bends on the seatstays. This conversion of forces absorbs energy from the bump force and improves comfort over irregular road surfaces.

While Attraction allows you to ride faster and farther, it has no effect on the ability of the rear triangle to transfer your power from the pedals to the pavement. Attraction is where comfort and performance are one.

Press Fit Bottom Bracket

We have chosen the Press Fit bottom bracket system for our newest high-end road bicycles. The reasoning is simple - Press Fit provides a new standard for stiffness and light weight. While saving a few grams is always nice, the greatest benefit is that the added width of the bottom bracket shell allows us to optimize the intersection of the down tubes and bottom bracket shell. This increases pedaling stiffness and, ultimately, allows for a more efficient transfer of your energy to the rear wheel.

There are other benefits with the Press Fit system. All three major component manufacturers support this standard and make compatible cranksets and bottom brackets. The nylon shell surrounding the bearing system on the bottom bracket makes the manufacturing tolerance more forgiving. The result is simpler installation, less maintenance, and less chance for creaky parts.

EC/DC - Internal Cable Routing:

The Internal cable routing of the new Orbea Orca is designed to provide efficient and direct pathways to the rear brake and derailleurs. This enclosed system will protect performance and reduce maintenance by shielding the cables from the grit and grime from the road. The completely internal system also offers a small aerodynamic advantage to go along with a cleaner look.

Perhaps the most unique aspect of our internal routing system is that we've designed it to be compatible for both electronic and mechanical (EC/DC) shifting systems. This was not available on the previous generation of the Orca. Now, you can use whichever system you prefer, and the new Orca will allow simple and easy installation.

Tapered Headtube

As our world-class competition bike, the Orca is designed with pure performance in mind. And to offer the best steering precision and control, we build it with a tapered headtube. This allows us to increase the diameter of the lower bearing, and likewise the steerer tube diameter. The result is a stiffer, stronger fork with no

appreciable weight gain. This is an integral part of what gives the Orca its confidence inspiring stability at speed through corners, even across lumpy pavement.

" From here... to there.

I'm looking for a cyclo sportive bike. I ride nearly 8,000km a year in 7 or 8 tours. The Dolomites, the Quebrantahuesos... long-distance tours that require a comfy bike, an efficient machine to improve my performance. This year I made my debut at the Pax Avant — a tough yet awesome adventure! I suffered and enjoyed it at the same time.

ASIER LAVADO Road cycling lover

HISTORY

THREE COWS, AND A DESTINATION.

What would you say if we suggest a course that has a history dating back nearly 650 years?

In 1375 the people of two opposing Pyrenean valleys, one Spanish and one French, made peace after years of border disputes. The local officials created an agreement through which the Gauls surrendered three cows to the Navarrese each year with a celebration in July. Political representatives and citizens of each valley come to witness and partake of the festivities that follow the ceremony. As in years past, three animals are selected and delivered. The act closes with the pronunciation of two words: Pax Avant! (So let there be peace!)

We will celebrate that concord with a cycling tour running through the two territories. The Pax Avant blends the charm of beautiful Pyrenean villages with the intensity and beauty of the Pyrenean landscapes. Everything is ready, do you feel like pedaling?

At the beginning and at the end of the adventure, we will seal the deal. We will pronounce: "Pax Avant". Join the challenge!

USERS

LOVERS.

Lovers and fans of road cycling, those who made 8000-15000 km per year. They like riding outdoor for long stretches. They are cyclist with high purchasing power, which demand high-end products. The Orbea Avant is the bike that ensures maximum performance and a dynamic, personalized experience for the user. That means highend technology product to perform in the most difficult marches and bicycle races.

FEATURES

CONCEPT

FROM HERE... TO THERE

This has been the undercurrent for its development - from mechanical to electronic, from rim brakes to disc, from one hub width to the next. These sorts of technical journeys are part of what this bike is about. It is also about journeys on the roads - all sorts of roads. In fact, the Avant can take tires up to 28mm. We are proud of its versatility. No matter where you choose to ride, this bike can be outfitted properly. It can be configured with fenders and racks if you choose to ride for adventure. Yet the discreet mounts are virtually hidden when the bike is prepared without them. How do you want to ride.

TECHNOLOGIES.

1. FIT

Stack and Reach Concept

The 2014 Orbea road bikes have a redesigned geometry that allows any rider to be fit easily and properly on the bike. We based our frame sizing on the concept of stack and reach, developed by Dan Empfield, a pioneer in understanding the height and length of bicycle frames. Stack and reach are important measurements because they define the spatial relationships of two important touch points between your body and the bike – pedals and handlebars. Stack is the vertical distance from the center of the bottom bracket to the top of the headtube at center.

An understanding of stack and reach can explain why many small bikes don't fit well. There are instances in our market when the smallest sizes do not offer shorter reach measurements and do not bring the head tube (therefore the handlebars) any closer to the rider than the next bigger size. In actuality, the way the bike fits is quite similar to the next bigger size save for a typically shorter stack on the smaller size. How does the manufacturer advertise a full size range then, based on top tube lengths? Changes in seat angle have historically been the answer. For a given reach, a steeper seat tube angle will result in a shorter top tube length. This old way of looking at sizing based on the top tube measurement can ultimately be deceiving. Reach, on the other hand, is a measurement that is unaffected by angular differences in seat tube geometry..

What we're suggesting is an evolution in bike geometry. It's a different way to look at how to design and build bike frames that allows the Avant sizing to follow a more linear size progression. Like the Orca, we're building the Avant in seven sizes. The goal was to have a bike that can fit riders of any stature. Our unique stack and reach based geometry means easier size selection and ensures an actual progression in sizing and fit, from the smallest size to the largest.

Our new road range will span two distinct geometry patterns that allow us to offer different fit styles. These differences address the needs and wants of all cyclists, man or woman, large or small. At Orbea, we know that everyone is different, with different bodily proportions, ranges of

flexibility, and intended riding preferences and styles. We are all cyclists, yet we are all individuals. This is why we're building road bikes with options - to get you fit first and riding comfortably in the end.

Of the two geometries, the closer reach / higher stack of the Avant yields a longer head tube and a higher hand position, with the handlebars a bit closer towards the saddle. The Avant offers a just-right blend of comfort and performance for many cyclists. It is a perfect bike for riders with limited flexibility or for those who desire the ability to have a more upright body position for supreme comfort over long distances.

Linear Size Progression

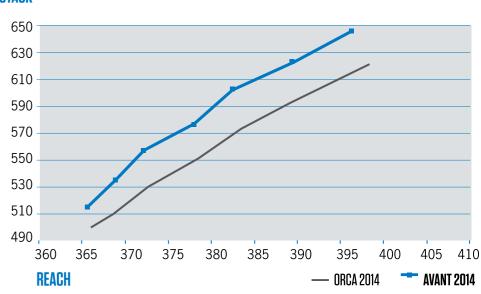

We've developed seven sizes for the new Orbea Avant. The frames are available in 47, 49, 51, 53, 55, 57, and 60cm sizes. This large range of sizes ensures that anyone can ride an Avant, no matter how large or small.

After analyzing our historical fit data, we concluded that we could greatly improve the fit options for our smallest riders. We are now offering new 47 and 49cm sizes. And since the Avant follows a more linear size progression, with regards to stack and reach, the 47cm bike indeed offers the smallest fit, with each subsequent size getting larger in a logical and predictable fashion.

To make these new bikes a reality, we've built two distinct forks for the Avant. The three smallest frame sizes use a specific

fork, with a 53mm rake. The larger sizes use a fork with a 43mm rake. This difference is necessary, along with a tuned head angle through the size range, to maintain correct steering and front triangle geometry that takes into account the dynamic interaction between rider and bicycle. We prioritize handling, comfort, and control. The end goal is a confidence inspiring user experience on the Avant. The two distinct forks allow that same experience, with a well-balanced riding sensation, across the size range. No matter the size, the new Orbea Avant offers quick handling and agility with predictable, high-speed stability.

STACK

"Monocoque isn't the easiest way to build bike frames, nor is it the least expensive. However we choose to use this process because it offers us the ability to produce the best bikes on the market."

2. AERODYNAMICS

Disc vs. Caliper Brakes

We tested the Avant in the wind tunnel, and we found that the aerodynamic differences between disc and rim brakes are negligible. At narrow yaw angles, our tests showed the disc brake equipped bikes to be faster. As the yaw angle increases out past 10° or so, the rim brake bikes gain the advantage. In the end, the choice is yours to make based on personal preference or desired braking performance.

3. CONSTRUCTION

Monocoque

Like the rest of Orbea's carbon fiber bikes, the Avant is made using a monocoque construction technique. This translates into a bike frame structure made as one seamless unit. We've been doing it this way since 2002, and our experience tells us that this is the only way to produce composite frames with the strength and durability to be worthy of our lifetime warranty.

Monocoque isn't the easiest way to build bike frames, nor is it the least expensive. However we choose to use this process because it offers us the ability to produce the best bikes on the market, and we won't compromise our standards to save a little money on manufacturing costs.

Part of the complexity of monocoque is the requirement of a dedicated mold set for each size frame. However, we can guarantee consistency and accuracy with the molding process, and monocoque allows us the freedom to create complex and beautiful tube shapes. This method of building the frame as one structural unit also allows the placement of continuous fibers that run through tube intersections in the frameset. The long fibers transmit forces throughout the tubes to reduce the chance for frame failure at critical, high stress areas

Each frame size bears a specific design, optimizing the performance of the frame structure according to the size and body mass of the intended rider. The result is seven individually designed frames - 100% exclusive and perfectly balanced. We achieve this by creating frame structures with optimized tube diameters and wall thicknesses, each variable being specific to a particular frame size.

This is a quality standard that we guarantee on our products, and which is far above the average standard required. The result of this painstaking attention to size-specific design is that the new Orbea Avant will provide similar ride quality and performance characteristics across the size range.

Press Fit Bottom Bracket

We have chosen the Press Fit bottom bracket system for our newest high-end road bicycles. The reasoning is simple - Press Fit provides a new standard for stiffness and light weight. While saving a few grams is always nice, the greatest benefit is that the added width of the bottom bracket shell allows us to optimize the intersection of the down tubes and bottom bracket shell. This increases pedaling stiffness and, ultimately, allows for a more efficient transfer of your energy to the rear wheel.

There are other benefits with the Press Fit system. All three major component manufacturers support this standard and make compatible cranksets and bottom brackets. The nylon shell surrounding the bearing system on the bottom bracket makes the manufacturing tolerance more forgiving. The result is simpler installation, less maintenance, and less chance for creaky parts.

EC/DC - Internal Cable Routing

The Internal cable routing of the new Orbea Avant is designed to provide efficient and direct pathways to the rear brake and derailleurs. This enclosed system will protect performance and reduce maintenance by shielding the cables from the grit and grime from the road. The completely internal system also offers a small aerodynamic advantage to go along with a cleaner look.

Perhaps the most unique aspect of our internal routing system is that we've designed it to be compatible for both electronic and mechanical (EC/DC) shifting systems. Now, you can use whichever system you prefer, and the Avant will allow simple and easy installation.

Tapered Headtube

Like our Orca road bikes, the Avant is designed with performance in mind. And to offer the best steering precision and control, we build the Avant with a tapered headtube. This allows us to increase the diameter of the lower bearing, and likewise the steerer tube diameter. The result is a stiffer, stronger fork with no appreciable weight gain. This is an integral part of what gives the Avant its confidence inspiring stability at speed through corners, even across lumpy pavement.

Disc or Rim Brakes

The Avant is unique in that it is fully compatible with traditional rim brakes as well as disc brakes. The advantage for the user is the choice. Products will be offered with both options, and the ability to make a swap from one brake style to the other is easy and simple. The frame is designed so that mounting hardware for the disc brakes is removable, leaving nothing but discreet, threaded bosses, with nothing to detract from the visual aesthetic of the bike.

Dropout spacing

With disc brakes in mind, we've designed the Avant to be compatible with 135mm and 130mm hub widths. The reason for this is simple - as the road disc standard develops, we wanted the bike to be compatible with any wheelset you might choose. The conversion is a simple affair and consists of removable dropout chips to effect the change in width.

EC/DC

The choice between mechanical and electronic shifting has become more blurred as electronic options come down in cost. The Avant is built with both in mind. The internal routing system is compatible with traditional cables or the more modern, electronic wiring systems. The Avant is available as a Di2 complete bike, and this product also includes a hidden, seatpost-mounted battery.

Discreet Fender, Rack, and Brake Mounts

The Avant is a bike that can "take you from here to there." This is the undercurrent for its development. From mechanical to electronic, from rim to disc, from one wheel to the next, these sorts of technical journeys are part of what this bike is about. It's also about journeys on the roads - all sorts of roads. We are proud of the versatility of the Avant, in that no matter where you choose to ride, this bike can be outfitted properly. It can be outfitted with fenders and racks if you choose, but the hidden mounting bosses won't attract attention at the road race on Sunday if you choose not.

Tires up to 28mm

Towards that adventurous spirit of the Avant, it is quite capable of accepting a 28mm tire - front and back. We've worked with this goal in mind, as the popularity of gravel road riding and racing has blossomed. The advantage with the larger tires is, of course, reduced chance for punctures. But the larger tires also significantly increase comfort for long days in the saddle. Both the rim brake and disc brake options are compatible with 28mm tires.

ANDREW STARYKOWICZ - Mr 4:04

[&]quot; It wasn't just about winning Ironman Florida. It was about making a statement start to finish of 'I'm not just gonna win, I'm gonna dominate'". Starykowicz rode his Ordu to a record time of 4:04:39 in the bike split at Ironman Florida. His elapsed time was 6 minutes and 54 seconds faster than the previous record. The aerodynamic and ergonomic improvements we developed for the Ordu are bound to secure another decade of supremacy. Who wants to be the fastest?"

HISTORY

For the last decade, the Ordu has been the most dominant bicycle in professional triathlon. It has been on the top step of the podium at nearly every major event worldwide, winning multiple championships at all triathlon distances including Ironman, 70.3, and Olympic distance.

And with great success, comes great expectations. The new Ordu was built to shatter those and to help you do the same to your personal best out on course. The Ordu evolution started with Computational Fluid Dynamics (CFD). We employ CFD to help us test our new bikes in a virtual wind tunnel to refine the shape before creating prototypes that we can test in the wind tunnel. Once we're satisfied with a shape, we employ rapid prototyping for actual wind tunnel testing. It is this multi-stage process, with continuous refinement and testing that creates a more aerodynamic machine.

ASSOCIATED TEAMS

"With Orca we can guarantee to deliver the best products for triathlon, not just in the bike leg, where we were already the fastest, but in the swim and run as well. "

Orbea is happy to announce a partnership with Orca in forming the Orbea-Orca Triathlon Team. With the goal of continued global growth for both brands, the team is composed of talented athletes from around the world. The main goal for the team will always be successes and race wins for our athletes, as Andrew Starykowicz achieved when he set a new Starykowicz achieved when he set a new Ironman distance world record on the new Orbea Ordu with his time of 4:04:39. The Orbea-Orca Triathlon Team project will support professional athletes as well as team of talented global athletes. This will mean brand involvement and support for the best young athletes in both long and short distance events.

Athletes racing in the Orbea-Orca Triathlon Team.

Pro Athletes: Andrew Starykowicz (US), Manny Huerta (US), Matt Sharp (UK), Courtney Atkinson (AUS), Ariane Monti-celi (BRA), Asa Lundström (SWE), Jenny Schulz (GER), Michael Poole (NZ), Jeff Symonds (CAN).

Talented Global Athletes: Albert Moreno (SP), Sky Draper (UK), Tamara Gomez (SP), Miriam Casillas (SP), Xisca Tous (SP), Judit Saizar (SP), Melina Alonso (SP), Camila Alonso (SP), Claudia Abreu (US).

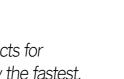

CONCEPT

FEATURES

DEVELOPED SLOWLY TO BE THE FASTEST.

Our goals for the new Ordu focused on improvements in three key areas - Ergonomics, Aerodynamics, and Ride Quality. These improvements are the result of feedback from our sponsored athletes, from comments from other riders in forums and blogs, from exhaustive development in our design and engineering departments, and from weeks spent in the wind tunnel. In the end, the new Ordu meets these goals and offers less aerodynamic drag and a better rider/ bike interface. This results in more comfort for you, saves you energy, and allows you to go faster.

TECHNOLOGY.

1. FIT FIRST

Beyond any other factor in high performance cycling, optimized fit between rider and bike is the foremost attribute we strive for. We designed this Ordu using a Fit First philosophy. Beginning with Dan Empfield's Stack and Reach concept and the experience of fitting thousands of athletes on Triathlon and Time Trial Bikes, we adjusted our fit coordinates to reflect the needs of today's athlete.

Our unique Monolink stem system is highly adjustable and offers a wide range of height adjustment without using shims. Each Ordu comes complete with four stem lengths - 75, 90, 100, 110mm. This way, you can be sure of a comfortable,

fast fit. The stem design accepts any base bar with a 31.8mm clamp, so you won't be limited to a proprietary base bar. We also made sure that any standard front brake can be used. You choose - You win. Like the stem. the Monolink seatpost offers an easy way to customize your fit. You'll be able to fine-tune your position with a total of four degrees of fore and aft adjustment from the base 78° seat tube angle. The total effective seat angle range is 76° to 80°. Each bike comes with dualrail adapters for the seatpost. This way you can use your favorite saddle if it is not Monolink compatible.

For smaller riders, our extra small Ordu uses 650c wheels to provide an uncompromised fit.

2. AERODYNAMICS

The leading edge of the bike received the highest priority for aerodynamic shaping. The Ordu is available with two different forks. A 1:3 UCI compliant fork will be the logical choice for athletes competing in sanctioned time trial events. For triathletes, we offer a non UCI compliant 1:4 fork that features a faster, more aerodynamic shape. Both fork versions are built with an integrated, structural nosecone that increases the chord length in this critical area of the bike, making it more slippery and smoothing the airflow across the frame. The fork is nestled in the frame using standard 1-1/8" integrated headset bearings to keep this area as narrow as possible. At only 38mm wide, it further decreases aerodynamic drag. In addition, these standard bearings are easily replaceable for routine maintenance. Any standard road bike front brake can be employed, making it user friendly and ready to accept the best the market has to offer.

The rear brake has been relocated to a concealed position underneath the chainstays. The brake arms are shrouded with a removable cover that ensures smooth airflow and protection from the elements. This lower brake position allowed us to redesign the critical seatstay/seat tube junction to reduce drag and smooth airflow over the rear wheel.

As a modern superbike, the Ordu gets completely internal cable routing. We've simplified the installation with one fra-

me that allows mechanical or electronic shifting systems and effectively hides it all from the wind. The cables or wires enter the frame through the top tube just behind the stem, only to emerge where necessary to connect each individual component. We've limited the exposed cables to a bare minimum – every effort to shave precious grams of drag.

In total, we reduced the aerodynamic drag by 11% versus the old Ordu. Tests were run at various yaw angles at the industry standard 30mph. We found the greatest improvements in efficiency at "real world" yaw angles. That's to say that you'll rarely find yourself riding directly into a head wind at 0° yaw. As the wind approaches the Ordu from an angle of 10° off center, which is very common out on the road, it offers the greatest improvement over the old design.

ny reduction in grams of drag is important because it takes less energy to propel the bicycle. This can mean one of two things: You'll be able to ride faster than the old bike at a given power output, or you can ride at the same pace with substantially less effort, saving your legs for the allimportant run.

The new Ordu can save you up to 30 watts over the older bike at 10° yaw. Over the course of a 40km time trial, ridden at 25mph, this increase in efficiency could result in a roughly two minute time savings! With the same data, we calculate that the new Ordu could potentially shave

roughly nine minutes from a 112 mile triathlon bike leg. Of course, efficiency may vary depending rider position and conditions.

You might ask, "what if I don't go 25mph?" Even if you average 20mph the decrease in aerodynamic drag is substantial enough to give you even greater time savings. Expressed as a percentage net loss of time, longer races result in greater savings.

FEATURES

3. RIDE QUALITY

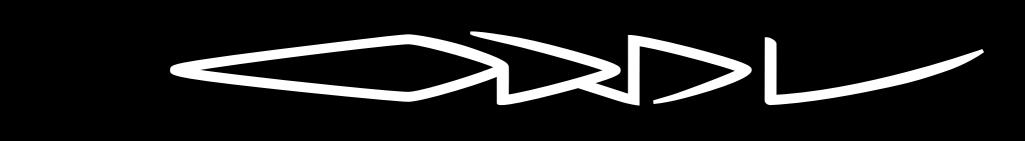

The fork and rear triangle of the new Ordu have been designed with improved shaping to optimize performance. This is called Attraction. We've used this technology in our Orca road bikes, and it has been proven in grueling World Tour races worldwide. The feedback from team riders was so positive that we were compelled to offer it on the new Ordu. In the same way, the Ordu uses Attraction to dissipate vibrations from the road surface. It's a way to make you more comfortable and help you get through your ride with less fatigue. With Attraction, comfort is achieved while maintaining lateral stiffness, thereby maximizing performance on the bike with optimal pedaling efficiency.

As our flagship TT/Triathlon bike, the Ordu is built with our finest materials. Here, we use Orbea Carbon Fiber. It's a blend of ultra-high modulus fibers used in order to offer the highest stiffness to weight ratio. The layup also receives the utmost attention to minimize superfluous grams and extract the greatest performance. Like our other models, the Ordu is built as a monocoque. This means that the frame is molded in one piece, with continuous, long fibers running through each tube intersection. The result is a frame strong enough to receive the Orbea Lifetime Warranty.

The carbon layup schedules (the number and orientation of the individual layers) are designed with each frame size in mind. The goal is to ensure that the Ordu offers a consistent ride quality across the size range. We call this Size Specific Nerve. The Ordu is built with four sizes, each tuned to an individual rider's size and body mass. This is how we can promise that performance is optimized and comfort is assured. You'll get to the finish line faster and fresher than ever.

Developed slowly to go fast, the new Orbea Ordu fits better and is faster and more comfortable than ever before. Join us for another decade of dominance.

ORBEA 2014 / BIKES / MTB / RALLON

BIKE ID

NAME	Orbea Rallon
USE	Enduro
CONSTRUCTION	Tricone Alloy
ORBEA VALUES	Lifetime Warranty Orbea Design
TECHNOLOGY	Advanced Dynamics, Pure Enduro Geometry, C9·12, Downtube Cable Highway, Direct Post Mount, Adjustable Geo

Time flies, it slips away and we can never have enough of it. What would you do with a little extra? The speed of the new Rallon gives you a few precious seconds to write your own story. Low, long and slack with 160mm of gravity-tuned travel, the Rallon can get you to the bottom of the hill as quickly as you dare. Short stays and a steep seat angle give the agility and efficiency to pedal up for one more lap.

ASSOCIATED TEAMS

ORBEA MÉRIBEL Enduro Crew.

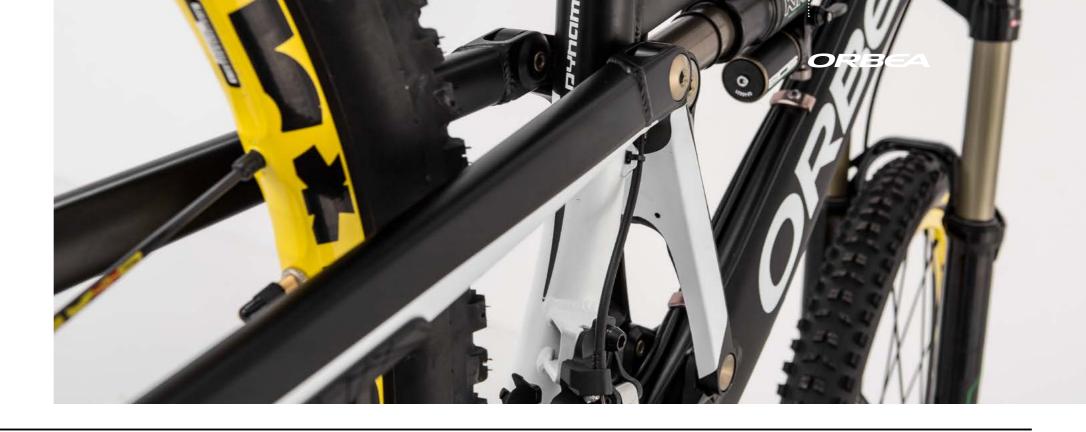

The Orbea Méribel Enduro Crew is an E.W.S. team picked to race and improve our bikes and have a hell of a good time doing it. Physical endurance, focus and technical riding skills set them apart and their unique riding experiences and knowlege provide us with the sort of input that simply can't be replicated outside the race course tape. When they ride, they push their strength, endurance and bike handling skills to the edge – the kind of riding that puts smiles on faces and tests our bikes to the limit. This is their mission and the new Rallon is their bike. and the new Rallon is their bike.

The riders of Orbea Méribel Enduro Crew during the stage in the Méribel ski resort in France.

CONCEPT

FEATURES

Time flies, it slips away and we can never have enough of it. What would you do with a little extra? We can't turn back the clock on a misspent youth but the speed of the new Rallon gives you a few precious seconds to write your own story on the mountain

Grab a few extra raspy breaths at the top of the climb. Whip instead of tuck. Knock your buddy off the leader board. Take the fun line instead of the easy line. Pull a snack from your pack or post a pic to instagram.

Sometimes a few seconds can seem like all the time in the world.

TECHNOLOGY.

1. Advanced Dynamics.

Advanced Dynamics simulates the interactions between the bike and rider to create suspension that performs in all conditions and terrain.

Advanced Dynamics is the heart of every orbea suspension bike. It is a process we developed in conjunction with CEIT (Technological Research and Studies Center of Gipuzkoa, Basque Country) that allows us to model and test our suspension platforms.

Using a vast database of shock tunes and component behaviors we can study a design under a virtual rider that exerts forces on the pedals, saddle and handlebars. We can shape the simulations to evaluate different variables – rider height, weight, riding style – on different tracks. even tire pressures can be tested and recorded before a welding torch is lit.

This virtual test process allows us to optimize our suspension designs before the prototyping and field testing phases. When the tires finally hit the dirt we can focus instead on fine-tuning damper characteristics and spring curves with our expert suspension partners. This is the obsessive tinkering that turns a good bike into a great one.

The result is a dynamic suspension system that is tuned for variable trail conditions with a leverage rate curve that is specifi-

cally matched to the spring and damper. Advanced Dynamics transforms virtual designs into real, highly-refined machines. Bikes for demanding riders that are faster, more fun to ride and far beyond ordinary.

2. Leverage Curve.

Linear/Progressive Curve. Offers maximum tuning capability with 10% progression to help suspension ride higher and recover faster.

Extreme sensitivity. Small bump compliance for optimum traction in flat turns and washboard terrain.

Maximum progressivity at full travel. Limits bottom out forces to frame, suspension and rider.

High Pivot Point. Great DH performance with improvements in pedaling efficiency due to natural anti-squad.

3. BOS and Fox tuning partnership.

Collaborative input. Modified extensively from R3 and early prototypes refined with input from BOS and Fox.

4. Pure Enduro Geometry.

Slack head angle: 66.5%66% (adjustable) > Great stability at speed through rough terrain.

Low bottom bracket. 14mm/21mm lower than previous Rallon > Corners naturally with low center of gravity.

Short chainstays. 420mm > Agility and maneurability especially at low speeds

Long cockpit. 11mm longer effective top tube, 25mm longer reach from R3 > Optimum balance and weight distribution.

Long wheelbase. 40mm longer than R3 > Better stability at high speeds.

Forward pedaling position. 75°/74.5° > Better pedaling position even with generous SAG.

Adjustable geo. A simple rotation of the shock mount pin drops the BB 7mm and slackens angles by 5°.

5. 27'5"

Choosing 27.5" - Testing with Simon Andre, Orbea Méribel Enduro Crew Rider

Decisions – "With 160mm rear travel and the aggressive geometry we desired, we limited our choice to 26 or 27.5. We were intrigued by 29 but decided that big wheels with this combination of travel, short chainstays and a versatile chaindrive (1, 2 or 3 by 10 or 11 gears) would require too many compromises to be practical."

Choosing 27.5" – "Testing the first two prototypes, we quickly became proponents of the 27.5 wheel. On technical sections the bikes were very close and in braking sections we had similar sensations from both sizes, but the 27.5 bike felt faster and more controlled in both wide open and rough terrain. It maintained speed better and cornered more confidently in flat turns."

Optimizing geometry — "Next we refined our 27.5" prototypes with subtle geometry changes and linkage tweaks from our first tests. this is when we fine-tuned the predictions made by the modeling software and realized that the 27.5 wheels were a perfect match to our prefered geometry."

FEATURES

6. Tricone Alloy

Refined. Premium Triple Butted and Hydroformed 7000 series alloy. 3.15kg medium frame/shock weight.

Efficient. Hollow rocker arm and proprietary yoke and dropout parts are light and stiff.

Tested. Quicker and more extensive testing of geometry as race tracks and trail riding evolve.

Suspension prioritized. Frame cost is kept lower with sophisticated suspension being the highest priority.

7. C9·12.

A concentric pivot at the rear axle is simpler, lighter and stiffer.

8. ISCG 05.

Removable tabs allow riders to customize the level of chain retention.

9. Downtube Cable Highway.

Clean, smooth bolt on system increases performance and decreases maintenance.

10. Freno post mount.

Disc brake bolts directly to frame and works with 180mm+ rotors.

11. Dropper post routing..

Ready for internal (stealth) or external post routing.

12. Frame protection.

Dual compound armor protects key areas of the frame from rock strikes or chain slap.

13. Adjustable geometry.

A simple rotation of the shock mount pin drops the bb 7mm and slackens angles by 0.5°.

BIKE ID ORBEA 2014 / BIKES / MTB / OCCAM ORBEA

NAME	Orbea Occam
USE	Marathon / Trail
CONSTRUCTION	Monocoque
ORBEA VALUES	Lifetime Warranty Orbea Design
TECHNOLOGY	Advanced Dynamics, C9-12, Diamond Link, Geometry, wiring, PP28.

Occam

We understand you like to enjoy the mountain at your own pace. Sometimes the beauty of the landscape means more than a technical descent. Other days it's a demanding trail that grabs your attention and reminds you why you love riding your bike.

Occam 29er

The new Occam 29 is perfectly suited for trails and long distance XC riding because it is efficient, light and offers a great level of control. With a 105mm travel, the bike is extremely fast and can go at a blistering pace across rugged terrain. Developed with the Advanced Dynamics technology, the Occam29 is an example of Orbea's strengths in the making of full suspension bikes.

USERS

The enduro/all-mountain segment has exhibited tremendous growth in the last few years, and we see it as having the potential to offer great media visibility and inspiring video/photographic content to support our marketing actions. In terms of explaining its meteoric growth and why it has the potential to be a way to influence consumers, enduro is perhaps the racing discipline that most resembles a fun weekend ride with like-minded friends who like to challenge each other to be better riders.

The Orbea Meribel Enduro Crew is pushing our bikes all around the world at the most important competition on this category, the Enduro World Series. Also, they are making a lot of noise at all the social media channels such instagram, facebook, twitter,... A very young and talented crew always looking for the next step.

CONCEPT

FEATURES

WHEN EFFICIENCY MEETS CONTROL.

The new Occam29 is perfectly suited for trails and long distance XC riding because it is efficient, light and offers a great level of control. With a 105mm travel, the bike is extremely fast and can go at a blistering pace across rugged terrain. Developed with the Advanced Dynamics technology, the Occam29 is an example of Orbea's strengths in the making of full suspension bikes.

TECHNOLOGY.

1. ADVANCE DYNAMICS

Advanced Dynamics is the result of a long process of research into full suspension systems. Until now, the technology used in these bikes was based on two-dimensional motion analysis, but Orbea relies on virtual analysis, where all the variables are taken into consideration: relative acceleration and speed in every bike-rider interaction and transfer of active suspension in all terrains, studied for the first time in the field of full suspension bikes.

The Advanced Dynamics cutting-edge technology uses exclusive software tools that provide engineers with thorough information about bike behavior. There is

also the information gathered in tests with prototypes, which turns Advanced Dynamics into the perfect tool to develop full suspension bikes.

Moreover, we have worked together with Fox to develop the setting for the soul of the Occam29: the shock absorber. An efficient pedal stroke, high speed and controlled descent need a special setting for the shock absorber. This is why it was one of the aspects we took care of for the best possible performance by this key component.

2. INNOVATIVE 29" GEOMETRY / OCCAM29

Speed, responsiveness, stability. These were three of the major goals the new 29er by Orbea should attain. To meet them, we developed the shortest chainstays (445mm) in a 29er. The head tube angle is 70° or 69° for full downhill control. The seat tube angle is 74° for great pedaling power. The longer top tube and the shorter stem work together for increased control.

3. CONCENTRIC 9-12

One of our construction solutions in the Occam, we have included it in the new Occam29 as well, as it minimizes weight, adds stiffness and safety, and facilitates the direct installation of disk brakes. The exclusive design of the Orbea C9-12 allows for excellent assemble of traditional rear hubs or the new 12mm thru axle hubs (X12, 12x142, 142mm, etc.).

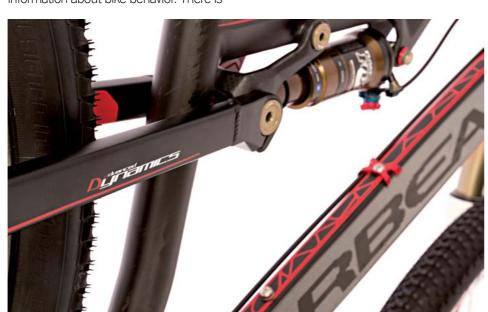

4. SEALED BALL BEARINGS

A bike with four pivot points would need eight ball bearings. Our bike has as many as ten. This bike offers terrific sensitivity because sealed ball bearings are used rather than standard bushings. However, the rear shock mount is what makes the difference. It keeps the bike really stiff and sensitive, and reduces friction while creating an ultra compact system that can be felt in the bike's unbeatable performance.

5. DOWNTUBE CABLE HIGHWAY

The Downtube Cable Highway routing solution keeps things tidy and simple in the new Occam29. The cables run along the upper part of the down tube, which prevents interaction with both the suspension system and the pedaling.

The derailleur cable runs inside all along. The rear brake and gear cables run on the outside of the tube. This way, the bike gets rid of cable rub in the main pivot point, and the lower part of the tube allows for placing a protector or carrying the bike up impossible trails.

"The Silver models are composed of light, high-modulus carbon fibers that provide stiffness and high impact resistance. It is a blend of high modulus fibers that ensure elasticity and high resistance."

4. OMS AND ORBEA HYDRO

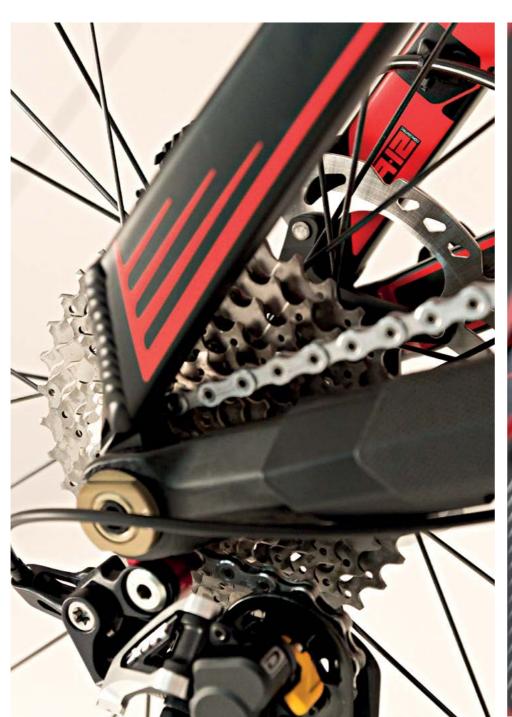

The Orbea Occam and the Occam29 are built in Silver Carbon or Hydro. The Silver models are composed of light, high-modulus carbon fibers that provide stiffness and high impact resistance. It is a blend of high modulus fibers that ensure elasticity and high resistance. This translates into a high performance bike that is as robust as a demanding rider like you needs.

The aluminum model is built in Orbea hydroformed triple butted aluminum. The material is extremely light and has impressive mechanical properties. It's made of aluminum, silicon and magnesium, and gets T4/T6 heat treatment at 5650 C.

Also, it involves complex hydroforming and triple butting processes that save weight while increasing robustness and reliability.

5. C9-12

One of our construction solutions in the Occam, we've included it in the new Occam29 as well, as it minimizes weight, adds stiffness and safety, and facilitates the direct installation of disk brakes. The exclusive design of the Orbea C9-12 allows for excellent assembly of traditional rear hubs or the new 12mm thru axle hubs (X12, 12x142, 142mm, etc.).

6. SEALED BALL BEARINGS

A bike with four pivot points would need eight ball bearings. Our bike has as many as ten. This bike offers terrific sensitivity because sealed ball bearings are used instead of standard bushings. However, the rear shock mount is what makes the difference. It keeps the bike really stiff and sensitive, and reduces friction while creating an ultra compact system that can be felt in the bike's unbeatable performance.

7. INSIDE BUSHING IN MAIN PIVOT POINT (28MM OD)

The main pivot point has an aluminum bushing, 28mm in diameter, to hold the 15mm ball bearings on both sides. Two conical parts add rigidity and watertightness as you tighten the main screw up. As a result, you get a precise, durable and noiseless bicycle.

8. DOWNTUBE CABLE HIGHWAY

The Downtube Cable Highway routing solution keeps things tidy and simple in the new Occam29. The cables run along the upper part of the down tube, which prevents interaction with both the suspension system and the pedaling.

The derailleur cable runs inside all along. The rear brake and gear cables run on the outside of the tube. This way, the bike gets rid of cable rub in the main pivot point, and the lower part of the tube allows for placing a protector or carrying the bike up impossible trails.

ORBEA 2014 / BIKES / MTB / OIZ

BIKE ID

NAME	Orbea Oiz
USE	XC Competition, XC Long Distance
CONSTRUCTION	Orbea Monocoque
ORBEA VALUES	Lifetime Warranty Orbea Design
TECHNOLOGY	Advanced Dynamics, U-Flexion by Orbea II, Monocoque, DCR. Weight: Frame w/s 1,5 kg

"I love it. It climbs rough single tracks like a dream. And it's really confident on the descents. I've really enjoyed the new bike. Thanks again for having it ready for me to test. Hopefully, people are convinced now that it's a world-class performance bike"

CATHARINE PENDREL

She won the 2012 World Cup events in rounds in Mont-Sainte-Anne, Canada, and Windham, New York, riding a new bike. In Canada on a tough and technical course, she crushed her rivals. She was riding the new Orbea Oiz.

HISTORY

ORBEA: PURE-BRED CHARACTER.

Our goal was also a challenge: to create the best full suspension XC bike. It took us 18 months at Orbea, interviewing users, designing and creating 3D environments, making prototypes and, finally, making the dream of every XC enthusiast a reality. With the Advanced Dynamics technology, we got the geometry we needed, adjusted the configuration of the pivot points and obtained the lightest, most efficient and perfectly stiff bike on the market. It's the F1 of full suspension bikes: it's the new Oiz.

NEW OIZ: BORN TO WIN.

After an unbeatable season, Catharine Pendrel became World Cup Champion for the second time, after winning the title in 2010. Without a doubt, today she is the best XC racer. So the Oiz was a winner even before being launched on the market! No-one knew it and yet everyone could see it. It was sent into orbit before it was born.

WC MT ST. ANNE CANADÁ

Two days before round 5 of the World Cup in Mont-Sainte-Anne, Canada, something came to Luna Chix from Orbea. The addressee was Catharine Pendrel. Along with the other riders of Luna Chix, she had participated in the development of the new Oiz. That day in June, Catharine got a prototype she would test in one of the most difficult courses in the World Cup. The Canadian rider of Luna Chix did something no-one thought she would do. She loved the bike and won the World Cup! It was the best possible start for this bike, even before being launched on the market.

2 WC WINDHAM NEW YORK

We called Catharine's Oiz 'the spy.' The reason was that we wanted her to test the bike in a race but concealing some features. Our designers created some graphics to hide the bike's shape. However, neither the Oiz nor Catharine were able to hide their world-class character, since they won in Windham too.

ORBEA 2014 / BIKES / MTB / OIZ

CONCEPT AND FEATURES

CONCEPT

FEATURES

PURE-BRED CHARACTER.

Orbea Oiz is a Formula One-inspired full suspension bike for the most extraordinary feats. A light bike, the Oiz weighs less than 9kg. It is also incredibly stiff and efficient enough for you to pedal powerfully in trails with loose rocks and roots, or speed up and go as fast as the wind. A bike to improve your performance every day, thanks to its unbeatable winning spirit.

TECHNOLOGY.

1. ADVANCED DYNAMICS

Advanced Dynamics is the most advanced full suspension design tool on the market. Leaving two-dimensional motion analysis behind, Orbea relies on virtual simulation to take into consideration the bike-rider interaction in all terrains. This way, we've determined the ideal location of pivot points for each type of bike: Rallon (enduro), Occam (trail/AM), Occam29 (long distance XC/marathon) and Oiz (XC).

Our racing teams Orbea Racing Team and Luna Chix helped us find the principles the new Oiz should be based on: traction, lightweight, stiffness and pedaling efficiency. Using the Advanced Dynamics software, we decided what the ideal configuration was of the pivot points to achieve our goals.

The main pivot point went up and was especially adapted to the double chainring that helps you deal with any obstacles on the trail, and the pivot point in the joints between chainstays and seatstays was removed using an F1 tech solution: flexible seatstays. In addition, customized shock absorbers were developed with the cooperation of RockShox and Fox.

In the Orbea design process, prototyping and field testing are a must. This time, it was Catharine Pendrel who tested the bike in the World Cup rounds in Mont-Sainte-Anne, Canada, and Windham, New York. After the races, she said:

I love it. It climbs rough single tracks like a dream. And it's really confident on the descents. I've really enjoyed the new bike. Thanks again for having it ready for me to test. Hopefully, people are convinced now that it's a world-class performance bike!

Leverage Ratio

The leverage ratio curve achieved by this bike is perfect for pure XC rides. Ready to use with a SAG even lower than 20%, it keeps an excellent geometry, and the regressive design allows you to use the entire travel.

2. MONOCOQUE

The Oiz has been designed with competition in mind. This is why Orbea carbon fibers were used both in the front and rear triangles, the link, the hangers, and other parts. Developed with monocoque structure, the bike offers the highest durable quality and the lightest possible weight. It's a fact: the frame, shock absorber excluded, weighs 1.5kg.

3. UFO II (U-FLEXION BY ORBEA)

We've done away with the pivot point on the rear wheel axle. The technology developed for the previous Oiz was upgraded for the new machine with flexible seatstays. With this innovation, we make ultralight bikes that require little maintenance and are stiffer for super fast acceleration like you've never seen in a full-suspension bike before.

The secret lies in the shape and materials. When properly handled, carbon can be bent, so we placed the fibers and shaped the seatstays in such a way that deformation doesn't reach the critical point. This technology, which has been long in use in F1 cars, delivers unrivaled weight-stiffness balance.

Along the lines of rigidity, we placed a steel tensor named Tensegrity in the joint between the link and the seatstays to balance lateral forces and provide optimal stiffness and very low weight. The construction solution does away with the rear axle that is used to increase stiffness but doesn't make a great looking frame. Instead, we designed a tensor to strengthen the seatstays-link joint with a very small yet highly effective element. How come no-one had come up with this idea before?

4. XC COMPETITION GEOMETRY

The Alma owes part of its success to the joint efforts made with our racing teams. It was the only way to develop the perfect geometry for XC racing. Our racers wanted a full-suspension Alma. And we adapted it to the requirements of a full suspension bike.

Chainstays: 420mm. They ensure brisk handling and regarding SAG, the geometry is the same as Alma's.

Seat angle: 74°. This is the angle you need in a race to go into attack position.

Head angle: 70°. Perfect for technical sections on trails full of obstacles. The head angle you need for this type of use is less aggressive than in a hardtail bike, since you have to overcome bends, rocks, roots, etc.

5. DCR **1**

In our search for efficiency and the best solution for every request, we designed this bike with DCR, a system in which the cables run inside the frame. The Direct Cable Routing system protects the cables, dramatically reduces friction and enhances durability. Results: Very low weight, minimum maintenance, optimal performance.

DCR is a unique cable routing system that guides the brake, gear and derailleur cables in a direct, highly efficient way. We managed to reduce maintenance. Thanks to the sealing, mud is no longer a problem, and the cables run entirely along the inside of the Oiz so that cleaning it is really easy.

6. FOX ICD INTEGRATION

The Orbea Oiz is the first bike that is compatible with one of the latest revolutions in the bike market, the Fox iCD system. This electronic system that controls the fork and the shock absorber has the perfect partner in the Oiz, which can make full use of all its features.

7. DOWNTUBE PATENT

An exclusive design by Orbea, it works as a fender and results in improved frame rigidity and biker protection. The downtube widens, optimizing stiffness and providing protection against mud, water and other annoying elements.

8. TAPERED HEADTUBE

The Oiz features an oversized, tapered headtube. This tapered headtube 1 1/8-1.5" adds stiffness and steering precision.

9. DIRECT POSTMOUNT

Why have an adapter for the rear brake calipers when you can mount the brake directly on the frame? We did away with two bolts and an extra part, creating a simple, clean and rigid set. We developed a stiffer system to reduce braking noise and increase rigidity.

10. PRESS FIT

This bike comes with a press-fit bottom bracket. It's an ultra wide bottom bracket that ensures optimal stiffness and the best pedaling sensations. In addition, sealing and maintenance are within the desired levels.

BIKE ID

"I train every day because I want to win.
It's my obsession. Wins come in the blink of an eye, but all the previous training takes a lot of time and effort. All of my muscles work as a perfect machine in my attempt to get better day after day. Alma is an essential complement when I try to become one with the toughest of terrains and win. It's as light as a feather, still so stiff that when I speed up, my rivals feel the impact, and it adapts to my characteristics like no other. Oh, and it's as nice as nature."

GEORGIA GOULD Rider of Luna Chix. In races, she rides an Alma.

ORBEA

HISTORY

2000 Starship Kilo.

First XC frame by Orbea made with Alu 6000 and triple butted tubes. Iñaki Lejarreta was the first rider to become Junior World Championship riding with this frame in 2000. Orbea Racing Team teammate Marga Fullana dominated and won numerous races of the World Cup with this machine. Carlos Coloma, Cédric Ravanel, Cécile Rode and Roberto Lezaun dominated cross country races on a Starship.

2005.

Alma was born in 2005 to conquer the mountains. The carbon fibers that run along the monocoque frame and all the technologies used in its construction made it a reference in its own segment.

THE FIRST STEP TOWARD MTB GLORY

The bike that was to lead the way to the future of MTB was born. A mountain bike with monocoque construction and all of Orbea's know-how of carbon-fiber technology. A bike that made everyone sigh when it rolled by, that everyone found amazing when they realized how light, stiff and smooth it was.

2008. Orbea alma SL 2.5R, A gold bicycle.

Winning gold is no piece of cake. You need the best biker ever and the best XC bike.

The Olympic Games in Beijing witnessed Julien Absalon and the Alma on top of Mount Olympus, where only superb bikes can be. Orbea put a limited edition of this bike on the market, staging an authentic revolution. It was the predecessor of the new model we introduced immediately afterwards, in which we applied our knowledge, passion and technologies. At that time, Orbea Racing Team, including Julien Absalon, Iñaki Lejarreta and Rubén Ruzafa, dominated the XC World Cup and World Championships. In 2007, Absalon became World Champion in Fort William.

2010. WE HAD A DREAM LAST NIGHT: IT WAS THE ALMA.

Alma is a dream. It's technology taken to the next level.

The flag of freedom on the mountaintop. This was how we described the second-generation Alma in September 2010. On the same path, the new Alma is bound to be the leader on the market and in races as well. We've worked hard to make an all-racing machine with an innovative design, as Orbea usually does. It is in our DNA; the Alma is like Orbea's soul.

2014 ALMA, POWER HAS NEVER BEEN SO SUBTLE.

Alma. Power has never been so subtle. After all these years, with all we've learned (good and not so good), we've moved further. Today, we're launching a state-of-the-art bike, developed with the latest technologies, design and engineering. An XC bike that is to lay the foundations for the future, because no-one will be able to overpower it.

CONCEPT

FEATURES

POWER HAS NEVER BEEN SO SUBTLE

The most exciting objects are those that illicit desire without reason. They have a personality that gives them life. A personality that makes them unique. To some, it is simply a bicycle. To others, it is inspiration. Desire. A communication between the heart and the mind. An organic feeling, applied with mastery...with respect to the history of the object...and treated to the smallest detail, makes it...an object of desire

Smooth becomes strength. Agility becomes accuracy. Lightness becomes power. Organic becomes pure emotion. Alma. Power has never been so subtle.

TECHNOLOGY.

1. Monocoque

The philosophy behind our bike design and manufacture leads us to put excellent, extremely durable solutions on the market. This is the reason why we have chosen the monocoque construction system. Constructed in a single piece, our frames offer the best capabilities in terms of light weight, stiffness and comfort.

Light weight: Made from carbon fibers, the Alma weighs only 950g.

Stiffness: The frames using monocoque construction have optimal rigidity for better rides and longer durability. The tests we perform on all the frames to check compliance with industry standards guarantee their reliability. Tests are performed to check the bike's lateral and vertical rigidity (seat tube, bottom bracket, headtube), among other features, before the machine reaches the market. That is, before hitting the road, so that everything runs smoothly on the bike.

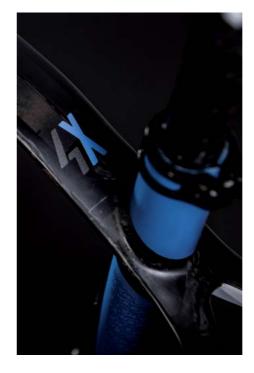

Comfort: XC courses are explosive and demanding. To face them, you need a bicycle that responds in every pedal stroke, that helps improve your performance. To make a responsive bike, we've extended the length of the chainstays and the downtube but reduced that of the top tube and the seatstays. The result is optimal rigidity of the lower part of the frame and increased comfort of the upper part. Facts speak for themselves: we make 211% more comfortable bikes while retaining the desired stiffness.

The new Alma has a 27.2mm-diameter seatpost for maximum comfort and performance.

2. 4x4

4x4 means full traction. Absolute reliability. Best results on any surface. This is Alma and this is its characteristic technology. Look at the Alma frame to see that both the front and the rear triangles are four-point instead of three-point triangles, as you might expect. We go beyond tradition and logic and we have many good reasons to do so:

Rear triangle: It has a longer distance between the anchor points of the seatstays and chainstays in the front triangle. By means of a gap, we obtained a longer distance between the chainstays and the seatstays. Direct consequences: With a longer distance we improved lateral rigidity by 15%. Besides, lateral torsion is considerably lower than in the frames made by our rivals.

Front triangle: A turn only 10cm from the seat tube, a new point that adds to the previous three to make a four-point triangle. Magic. 4x4. Advantages of this new feature:

Improved rigidity: We improved the Alma's lateral rigidity by 15%.

Improved comfort: The new angles created on the front and rear triangles allow the downtube and seat tube to merge in a lower area for greater impact absorption, even on the roughest terrains. With this we make 211% more comfortable bikes.

Less lateral torsion: The reduced lateral torsion means better transmission of the rider's power.

3. BWC

The Alma geometry has been redesigned for better adaptation of the frame to various sizes: the bottom bracket moved up and the headtube became shorter. The result is an unrivaled attack position in XC races.

Stack and reach: The stack & reach concept involves the longitudinal measures from the seat to the handlebar and from the headtube to the front wheel axle. Taking these measurements, we passed from the previous seven sizes for the Alma 26 and 29 to the current five sizes (two with 27.5" and three with 29" wheels) to cater for the whole range of XC riders.

Chainstays: The chainstays of the Alma are the shortest on the market. Being 436mm in length with 29" wheels and 423mm with 27.5" wheels, this bike performs great in all courses, with the best rear drivetrain response.

Sizes. The new Alma's geometry grows linearly, and with this concept, the smaller sizes come with 27.5" wheels while the bigger ones use 29" wheels. We believe size matters: the bigger the better. This is why we approach sizes considering users' height. Depending on how tall users are, we offer them bikes with 27.5" or 29" wheels. Features. Arguments

SIZE	DIAMETER	WHEEL
16	27,5	S
17,5	27,5	M
17,5	29	M
19	29	L
21,5	29	XL

FEATURES

4. DCR

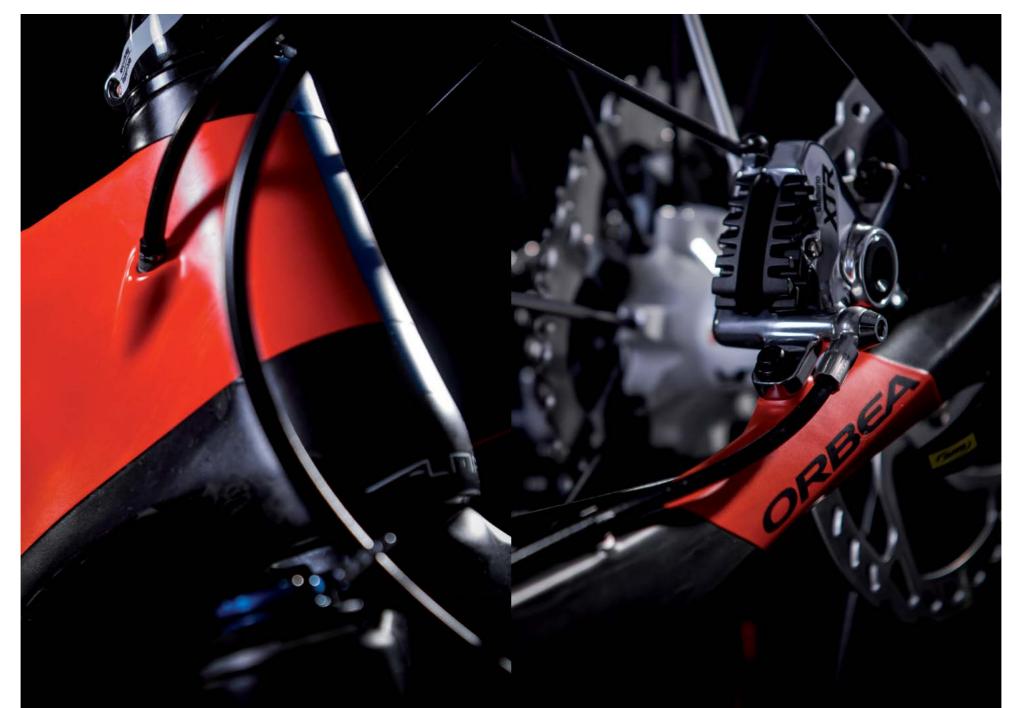

Cables run inside the frame: Direct cable routing (DCR) is a unique cable routing system that guides the brake, gear and derailleur cables in a direct, highly efficient way. This system allows for lower maintenance and an absolutely clean bike.

- · Lighter weight.
- · Less maintenance, protection from the elements (mud, dirt, etc.).
- · Less friction.
- · More durability.

5. Press fit

The Press Fit system of the Alma provides extra rigidity, enhanced transfer of power to pedals and lighter weight. The bottom bracket moved up 5mm for improved performance on technical or rocky sections.

- · Ultralight.
- · Stiffer
- · Optimal transfer of power to pedals.

6. Direct Post Mount

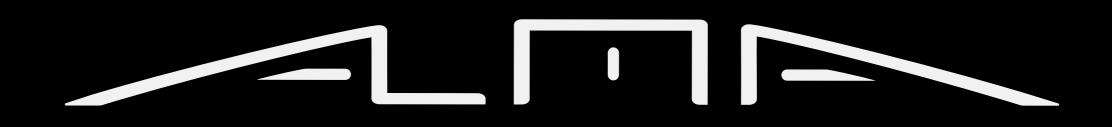

Why have an adapter for the rear brake calipers when you can mount the brake directly on the frame? We've done away with two bolts and an extra part, creating a simple, clean and rigid set. We've developed a stiffer system to reduce braking noise and increase rigidity.

7. Tapered Headtube

The Alma features an oversize tapered headtube 1 1/8-1.5" that adds rigidity and riding precision. Also the headtube is shorter for better riding position. Longer headtubes hamper maneuverability, which is why our tubes feature an optimal length that enable users ride the Alma smoothly, even in difficult environments.

8. Di2 Ready

The new Alma is ready to carry new technologies. Ahead of the times, this frame is compatible with electronic gearing systems, which are bound to become the standard system in mountain bikes. The Alma can accommodate the battery pack of the new electronic gear-shifting system, which allows for effortless shifting, requires low maintenance and will certainly place our bike with the most advanced in terms of industry technology.

TECHNOLOGY	MX Compact Geometry, super Strong Neck

"To me, mountain biking means fun, getting fit and enjoying nature. I need a strong, responsive bike that won't fail. A companion that meets the needs of my weekend outings. My choice? The Orbea MX."

THOMAS FOUQUET Nice (France).

ORBEA 2014 / BIKES / MTB / MX

CONCEPT AND FEATURES

CONCEPT

FEATURES

SERIOUS FUN.

The MX are technologically innovative The MX are technologically innovative bikes that have been designed for terrific fun with the essence of MTB: nice races between friends, off-road trails, long routes, a cyclo sportive once in a while, laughter and nature... MTB at its best!

MX COMPACT GEOMETRY.

Orbea MX Compact Geometry is the key technology behind MX bikes to improve the performance of mountain bikers who, above all, want to have fun!

It very noticeably improves steering control, agility and stability, both uphill and downhill, on the trail or off-road, and provides maximum pedaling performance for bikers who are looking for riding "FUN".

1. ERGONOMICS.

Small changes but big improvements for great FUN.

Ergonomically speaking, the pedaling position is more 'natural', which leads to reduced fatigue and improved bike handling. This is particularly important if you aren't interested in lifting the World Cup but are always ready for big fun.

2. AGILITY.

You'll see how easy it is to negotiate areas that seemed difficult before. The bike is agile in both ascents and descents on all terrains.

This frame with pronounced slope provides extra riding agility, which means more fun as well as greater safety and maximum comfort. In our labs, we tested the frame for rigidity, but the long seatpost helps 'absorb' vibrations before they reach your back.

3. STABILITY AND SAFETY.

The MX move safely and reliably... The secret? We've lowered the biker's gravity center.

We've lowered the gravity center, by slightly lowering the bottom bracket for you to ride in a more stable fashion. The result is remarkable balance and perfect composure in uphill and downhill riding. This is one of the distinguishing features of the MX Compact Geometry.

4. CONTROL.

The MX Compact Geometry takes the bicycle as a whole, not just the frame. With the 70mm stem we've got a stable bike on descents because the handlebar stem stands a few millimeters behind the front wheel axis and enables the biker to slide their weight back on technical sections. It's here that you'll notice how the control of the bicycle has improved (it can save you a crash or two). However, it's good in every riding environment, even on flat roads, because this type of bike is remarkably easier to handle. Everything will be in your full control!

SUPER STRONG NECK.

This technology, used in the Rallon, the Occam and the MX, is the result of computer-based resistance calculations (or finite element analysis) that help us optimize Orbea's product performance. Modifying the front part of the top tube, we got a stiffer front end. The bike is thus safer in all riding conditions, especially on loose rocks, roots and mud, which are commonplace in mountain biking areas.

4S.

4S, ORBEA'S TOTAL TRACTION TECHNOLOGY!

Its four-vertex rear triangle ensures us greater rigidity and transmits all the power, reducing lateral torsion as much as possible (we've calculated it using finite element software, tested it in our laboratory and, in particular, felt it over the terrain).

HEXATUBING.

The polyhedral shape of the tubes improves the strength and rigidity properties of the entire frame.

The development of tubes with edges on Rallon, Occam and MX models provides better performance in terms of overall frame durability, rigidity and strength. The feeling on the bike is more "compact" and solid

INTERNAL CABLE ROUTING.

Your MX is always ready! In addition to its clean esthetic line, the ICR system lengthens (x10) the gear change system, making it smoother.

The gear change cables need the most maintenance of anything on a conventional mountain bike. If you take a little longer ride and it's raining or there's mud (or even if you just wash your bike with pressurized water), you'll probably have to replace the cables and gear covers after only a few rides, since they get dirty and no longer operate smoothly. When they stop operating smoothly, we have to use more force on them, which results in wear and tear on the mechanical systems and causes them to lose precision. Orbea's complete ICR cable system prevents all this, and your MX will always be ready! (When the time comes when you do need to replace the cables, you'll be surprised how easy this is with the ICR system. Much easier than on a conventional sys-

26"/29".

"Big Wheel" or "Small Wheel"? That's the question!

At Orbea, we've conducted different tests with both our racing team and novice and experienced riders. Results have shown that performance and fun (each independently from one another) clearly improve with both size extremes. The little ones with small wheels, and the larger ones with 29" wheels. In the middle of the size range, performance, stability and comfort are generally greater with 29" wheels, but some riders have shown a preference for the more sensitive 26" wheels, so you'll find both options in the M and L sizes. This represents a greater manufacturing effort that few brands would take on; but for us, the important thing is to offer what's best for each rider.

FUSIBLE DERAILLEUR DROP-OUT.

A replaceable rear derailleur hanger can "save" the life of your frame.

A replaceable derailleur hanger is essential if it gets hit hard (as the result of a fall, during transport, etc.). The part gets damaged, but it's a simple matter of replacing it (otherwise, the damaged part could be the frame, in which case the repairs will always be a lot trickier).

So this factor may prove more important than it would seem!

EASY RACK.

Decide on the spur of the moment if you want to carry weight.

If you decide to mount a pack rack, it's important to point out that this frame is designed for easy mounting, with large, quality bolts (that are still discreet, matching the overall look of the bike). We recommend you use Orbea's pack rack as the perfect esthetic and functional match for this model.

POST-MOUNT DISC STANDARDS.

Post-mount disk brakes are the new market standard.

Because of their easy, precise adjustment, post-mount disk brakes have been gaining ground and are the most common standard in the market (having surpassed the IS system).

WOMEN'S ADAPTED MODEL.

Seat specifically designed for women riders

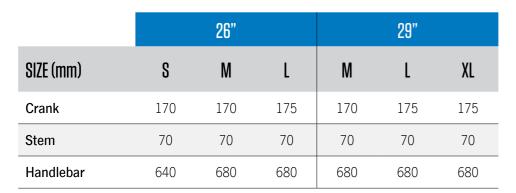

Women riders have the option of requesting that their MX bike come factory-equipped with a more comfortable seat adapted to female ergonomics.

ORBEA 2014 / BIKES / ALL USE

BIKE ID

NAME	Orbea All Use Sport and Confort
USE	MTB
CONSTRUCTION	Orbea Alu
ORBEA VALUES	Lifetime warranty Orbea Design
TECHNOLOGY	Easy Ride Geometry, Sloping/ Entrance/Open, Comfort Pack, Internal Cable Routing, 26/28, Fusible Derailleur Drop-out, Easy Rack

"I ride in town and on the mountains, this is why I need a bike that's good for both environments. It must move easily across town and take me out to the country on weekends. An all-terrain machine. I've found the All-Use by Orbea, a versatile bike that goes wherever I want. An all-in-one bike to ride in town and the mountain"

ANDREU GASCÓN Barcelona.

"I live in a city but I love nature. To me, a comfortable position on the bike is the most important thing. I want the bike to carry me leisurely in the streets or down a greenway. Actually, I look for a comfortable, relaxed position. I want my bike to be my everyday companion in my quest for tranquility."

SIMONE GEYSELS Brussels (Belgium).

CONCEPT

FEATURES

Orbea's All-Use range is designed to produce bikes that are above all versatile, attractive and that incorporate new technologies into affordable products. They'll go along with you as you do sports, in your leisure time and on your daily commute. They're ready for whatever you want.

ALL USE SPORT

All-Use Sport bikes are designed for mountain bike riding with no limits, and to accompany you wherever your daily travels take you.

ALL USE CONFORT

If what you're looking for is a bike with a comfortable position for excursions and getting around the city, you'll love Orbea's All-Use Comfort model.

TECHNOLOGY.

1. EASY RIDE GEOMETRY

Designed for natural, comfortable riding.

The ergonomics of All-Use bikes provide improved control, thanks to a lower center of gravity, a more natural riding position and maneuverability that is enhanced by the frame design.

It's while you're riding that you'll be surprised by how comfortable the All-Use bike really is and how easy it is to travel over any terrain and in any situation.

2. SLOOPING/ENTRANCE

Think about what you'll use your bike for and how you'll use it to know what frame suits your needs.

The frame determines the bike's character

For a comfy bike with a sportive character, choose the Sloping frame. The Entrance frame is more comfortable and can carry saddlebags or a baby seat, and you can easily mount and dismount from the side center. The most comfortable bike of them all, however, is the Open.

As you can see, it's easy!

3. SPORT PACK

All-Use SPORT, equipped for pure mountain biking.

You need to be well equipped for mountain biking. A super-oversized mountain bike handlebar and grips you can hang on to for greater control, a sports seat, tires with good grip, double-wall rims and sport pedals. All the assurance you need to head out to the mountain, and there's even a model with disk brakes. With All-Use SPORT, you can enjoy pure mountain biking. Don't forget your helmet!

4. CONFORT PACK

ALL-USE COMFORT = Versatility with Comfort.

All-Use Comfort bikes are designed and intended for riding comfort. That's why they have a higher handlebar and adjustable stem, so you can adjust the bike to your natural position. It also has details like ergonomic grips, nice pedals, and of course, a very comfortable seat.

Top models also include seat and front wheel suspension.

All-Use Comfort bikes are mainly that... Comfortable!

5. INTERNAL CABLE ROUTING

Your All-Use is always ready! In addition to its clean esthetic line, the ICR system lengthens (x10) the gear change system, making it smoother.

The gear change cables need the most maintenance of anything on a conventional mountain bike. If you take a little longer ride and it's raining or there's mud (or even if you just wash your bike with pressurized water), you'll probably have to replace the cables and gear covers after only a few rides, since they get dirty and no longer operate smoothly. When they stop operating smoothly, we have to use more force on them, which results in wear and tear on the mechanical systems and causes them to lose precision. Orbea's complete ICR cable system prevents all this, and your All-Use will always be ready!

(When the time comes when you do need to replace the cables, you'll be surprised how easy this is with the ICR system. Much easier than on a conventional system!)

6. 26/29 SPORT

Choose your wheel! It's easy. We'll give you some hints!

At Orbea, we've conducted riding tests with different users, from beginners to professionals, and the results show that for size S, users do better with 26" wheels. On the other hand, large sizes do better with 29" wheels. For the sizes in the middle, those who are mainly going to use their bikes for sports usually prefer the stability and performance of 29" wheels, while those who are going to do a lot of riding in the city are normally better off with 26" wheels, which give them greater agility at low speeds.

7. 26/28 CONFORT

Choose your wheel! It's easy. We'll give you some hints!

At Orbea, we've conducted riding tests with different users, from beginners to professionals, and the results show that for size S, users do better with 26" wheels. On the other hand, large sizes do better with 28" wheels. For the sizes in the middle, those who are going to ride a lot of routes or rolling stretches (a lot of travel in the bike lane, long distances, etc.) usually prefer the tread of 28" wheels, while those who are going to do a lot of riding in the city are normally better off with 26" wheels, which give them greater agility at low speeds.

8. FUSIBLE DERAILLEUR DROP-OUT

A replaceable rear derailleur hanger can "save" the life of your frame.

A replaceable derailleur hanger is essential if it gets hit hard (as the result of a fall, during transport, etc.). The part gets damaged, but it's a simple matter of replacing it (otherwise, the damaged part could be the frame, in which case the repairs will always be a lot trickier).

So this factor may prove more important than it would seem!

9. EASY RACK

Decide on the spur of the moment if you want to carry weight.

If you decide to mount a pack rack, it's important to point out that this frame is designed for easy mounting, with large, quality bolts (that are still discreet, matching the overall look of the bike).

We recommend you use Orbea's pack rack as the perfect esthetic and functional match for this model.

BMX

ORBEA 2014 / BIKES / URBAN / BMX

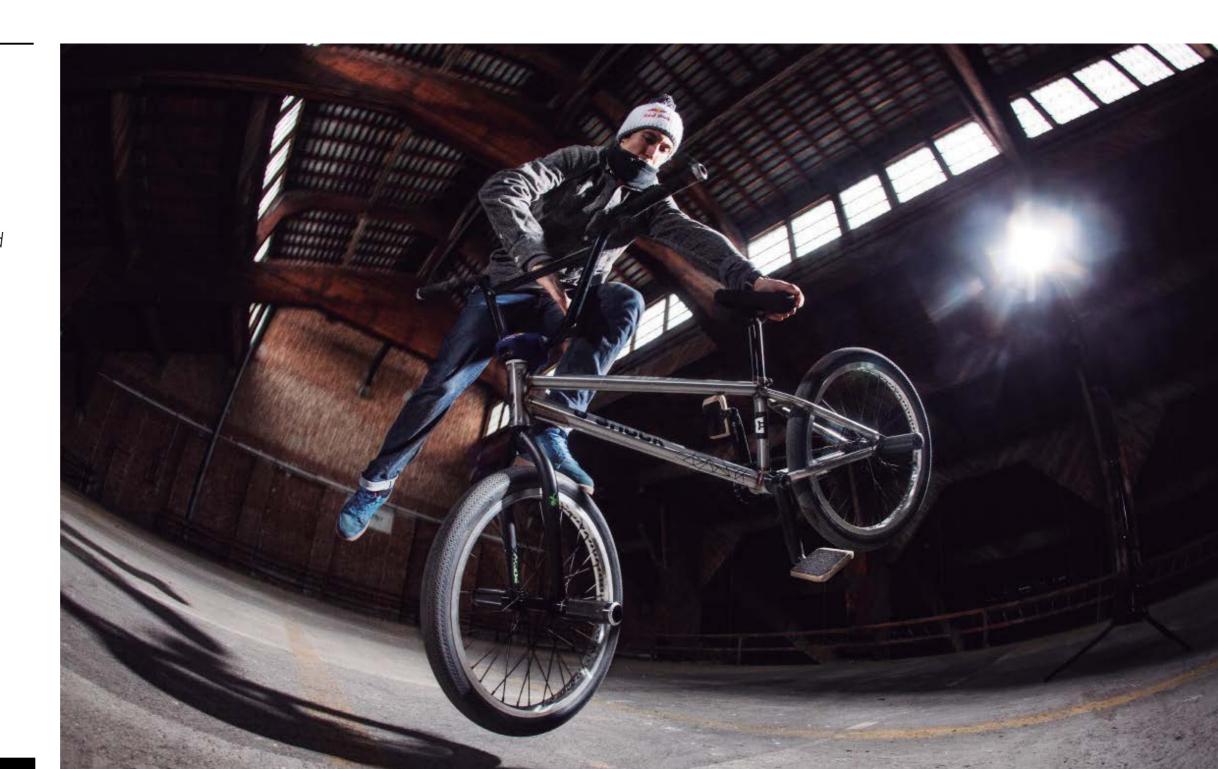

BMX

"I wish young riders had the chance to experience the origins of the Freestyle: riding as a means of body expression and all disciplines merging into one."

"I sketched the frame to allow riders to combine Flat and Street tricks. I'm proud of the result, it's unique and limitless, ready to take on the steets."

VIKI GOMEZ

BMX Flatland World Champion

HISTORY

Summer 1991, Viki Gomez jumps on his old Orbea Campeón for the first time in his life. Sixteen kilos of bullet proof steel. Things were easier back then: one bike, a back yard and an entire world of possibilities to peel off elbows and knees.

Years later the tricks would come, the easy ones first and the legendary ones later; and together with them the new materials, the specialization of the sport, the competition. Viki picked Flatland and down this alley he would reach the glory: the World Championship.

That's how we got to 2012. An heterogeneous BMX community is scattered in a sophisticated universe of BMX disciplines: Street, Park, Vert, Dirt, Flat, etc. They'all share one shared passion though: the Freestyle. Meanwhile one unanswered question starts to become increasingly disturbing in Viki's mind: Would it be possible to build a bike to combine several BMX disciplines in a single one?

Viki sketched an answer to this question and approached Orbea with a novel and unique proposal, one hybrid BMX bike that would allow the rider to enjoy the magic and balance of Flatland, the adrenaline of Street and the technique of Park. Could we build it? Challenge accepted.

Our engineers teamed up with Street, Park and Flat riders and hand in hand they shaped the first prototypes. According to Orbea quality standars, frames were tested in the lab and in the field to reach the optimal stiffness/weight ratio.

Fourteen months and a docen prototypes beaten to death later, our efforts found reward. Orbea's "enfant terrible" is finally ready to run free on the streets. Please welcome the new Orbea RUDE.

CONCEPT FEATURES

"Fourteen months and a docen prototypes beaten to death later, our efforts found reward. Orbea's 'enfant terrible' is finally ready to run free on the streets."

THE STREETS, MY KINGDOM.

Is it possible to design a bike to enjoy the magic and balance of Flatland, the adrenaline of Street and the technique of Park?

Viki conviced us that it was, we built it and riders loved it.

VIKI'S LEGACY FRAME 1

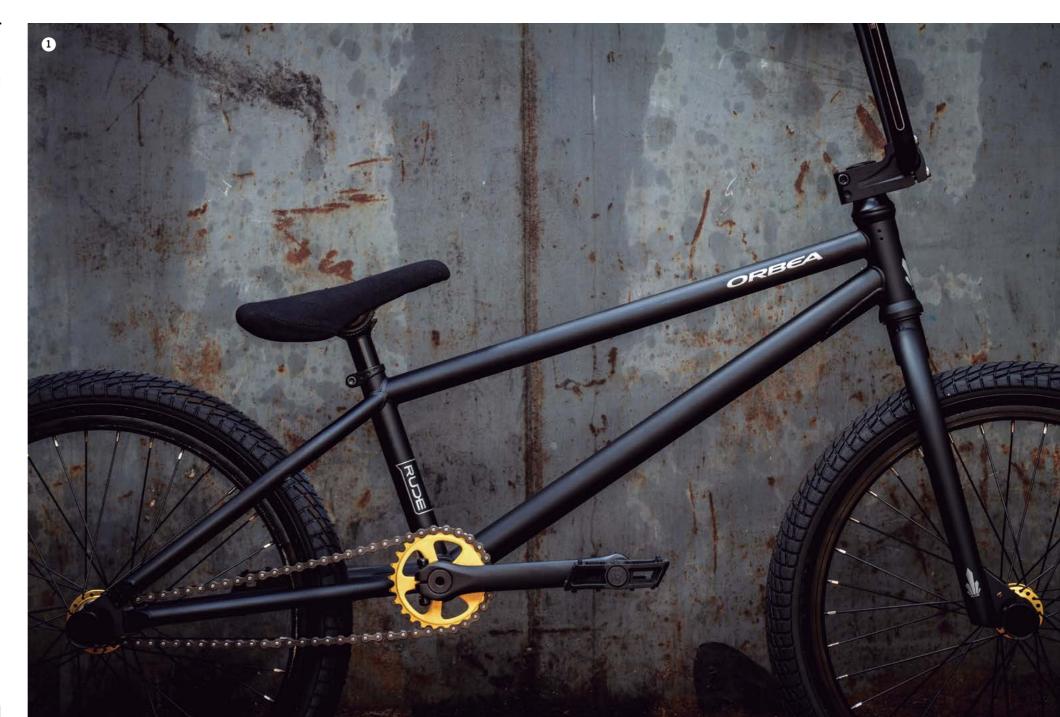

Orbea accounts for more than 90 years of history building life-lasting frames.

The aquired knowledge combined with the latest technology on Japanese Chromoly manufacturing and the creative design by Viki Gomez has resulted into a unique and reliable BMX frame.

SLOOP-A-HOOP

If you are going to try flatland tricks like "Boomerang" or a "Fire Hydrant" you want to have clearance between the seat and the handlebar.

In bike geometry this translates into a great slooping (= short Seat Tube) and for the RUDE we decided to name this SLOOP-A-HOOP.

"A bike to enjoy the magic and balance of Flatland, the adrenaline of Street and the technique of Park."

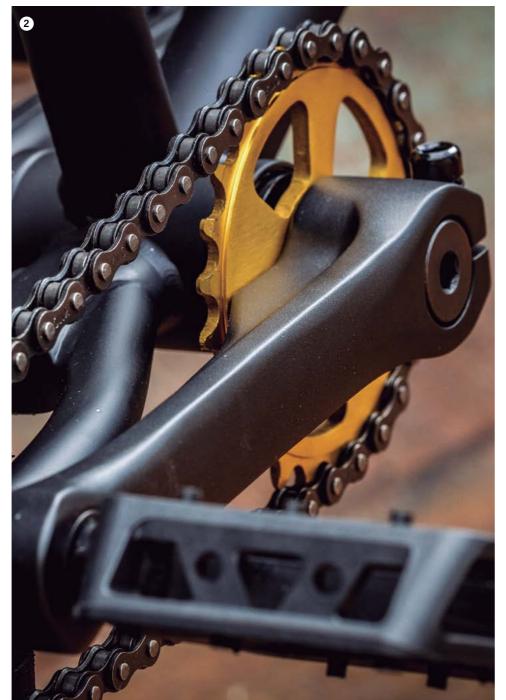

TTT: THIN TOP TUBE

As opposed to traditional frames we decided to use the same tubing for the TT and the ST, Ø28.6mm double-butted tubing. A thin top tube enables the rider to perform specific flatland tricks while ensuring a good performance on street or park rides.

SCS: SHORT CHAIN STAYS 2

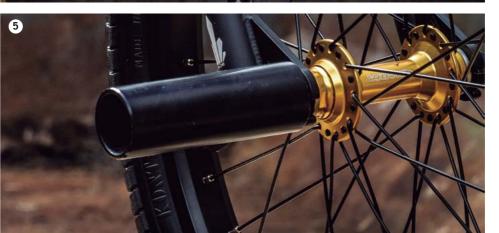

Short CSs make the bike easier to lift. Different size riders street-tested our protoypes until we found the optimal compromise.

The resulting CS lenghts are: S size (19,6"): 12,7" M size (20,75"): 13,2 L size (21"): 13,2

CLEAR HEADSET

Viki's Legacy Frame features an integrated headset. This, together with the removable cable guides result into a neat HT.

RUDE CUSTOM DROPOUTS 3

Early feedback from our riders showed us the importance of smooth-integrated dropouts. RUDE's custom dropouts enable safe and smooth landing on the pegs during tricks.

VIKI'S LEGACY BAR 4

Viki handcrafted RUDE's handlebar featuring a 8,25" crosspiece that enhances the aesthetics and gives the desirable strengh levels for intense use. Max. length: 28,5".

P4A: PEGS FOR ALL **5**

By defeaut, we serve the Orbea Rude with four pegs so you don't have to buy an extra pair to try Flatland tricks.

MODELS

"It's a bike, but it also means feeling free, getting a nice breeze on your face while riding your first bike, going out on your bicycle for the first time, feeling independent on your first vehicle ever."

GROW O.

Grow 0 is the ideal machine to get the dynamic balance and the safety every child needs when learning to ride a bike.

In terms of design, thanks to the bike's ergonomic lines, the rider (up to five-year-olds) can lift their feet and keep the proper riding position.

The feel is compact and light, because the frame and the components are made in aluminum.

Although it's considered to be a useful vehicle for trips of 1km maximum, there have been records among our meticulous testers.

It's children who turn the GROW 0 into a new, special object that they can use even after they learn to ride a bike. When they master it, they can find new features and go on having fun and learning new skills. The Grow 0 will continue to be their vehicle of choice on many occasions.

GROW 1 AND 2.

Sometimes, objects go further. This is the case with Grow. It's a bike, but it also means feeling free, getting a nice breeze on your face while riding your first bike, going out on your bicycle for the first time (genuine adventure trips), feeling independent on your first vehicle ever, and many other experiences and sensations associated with the machine itself.

Grow is a bike that we've designed bearing all these things in mind.

We've also considered the need for durable quality products that help protect the environment from an industrial and social perspective – a goal you can achieve through ideas, design and action.

MX 20 AND 24.

The new MX bikes are revolutionary in terms of sporting ambition. They've been carefully designed, something that can be seen in each aluminum tube or component. The latter have been chosen for their capabilities, with heavy use in mind. Looking at young bikers riding their MXs on the mountains is really amazing. They are no longer kids on wheels; they become fully-fledged bikers. With the new MX, they look like kings and queens of the mountains, negotiating really tough offroad descents and riding easily across flat terrains. Now, when you go out with your children, you won't need to push them: just grab your own handlebar.

To be honest, when we started developing the MX, we didn't know where the limits were in bikes for children. We decided to work hard to find them but couldn't see them! In the process of this search, we found out how to make a revolutionary bike. It was the new MX.

FEATURES

OK'S OPTIMIZED.

Geometry and lightness make the bike usable and provide good weight balance when rolling or handling the bike at a standstill. The Grow 0 is particularly fast when riders decide to turn back and return to the park at full speed. Lightness shows when the bike is carried by strong, big people – like parents or grandparents.

The large rounded tubes, the ergonomic nonslip footrests, and the limited turn system by Orbea can prevent a few crashes and bruises.

GROW SYSTEM.

These are bikes that really grow up with kids. They're durable quality bikes that are good for them, and good for all. The GROW bikes are designed to grow along with their riders. A simple feature doubles the bike's average lifespan. This means:

- Better ergonomic fit than traditional bikes (most kids ride smaller or bigger bikes than they should be riding).
- Lower cost for the buyer (you get a product with a much longer lifespan).
- Higher component quality (durable products must have quality parts).
- Lower environmental impact (it benefits all).
- EASY RIDE geometry: It makes the GROW bikes shorter, so that they can be used by smaller children, who can learn to ride them easily because these bikes are pedal-less (GROW 0). In addition, EASY RIDE makes the bikes safer, more stable even at a standstill (when keeping balance is very important), for kids who are learning and those who 'already know' how to ride a bike.
- The GROW frame is made in aluminum for a lighter bike and a quality reflected in the bike's solid and reliable feel.

The GROW design and components are legally protected.

SL BIKES (GROW 1 AND 2 MX 20 AND 24).

The light weight of Orbea's products for little kids and youngsters results in amazing usability. We're sure our bikes for young riders will set new market standards.

To accomplish this, we make our bikes – frame and components – mostly in aluminum.

If lightness is a desirable feature in adult bicycles, it's even more important in bikes for kids. Why is this so?

Kids are not as strong as adults (we mean physical strength only!), which makes them more sensitive to weight.

Taking the bike and rider together, the former is proportionally larger when the user is a kid. This is why every kilogram a bike maker can take off a bike's total weight counts: The lighter the bike, the lower its weight in the rider-machine complex. And we've managed to take off quite a few kilos!

If the bike weighs less, it can be handled more easily at a standstill, which is really important for the riding experience to be nicer.

X1 (GROW 1 AND 2, MX 20 AND 24), ORBEA MINIPRO GEOMETRY (MX 20 AND 24).

We wanted to make bikes that kids could ride and embark on real adventures ending at dinner time. This is why we also worked on transmission, until we came up with an adequate gear ratio.

For pedaling power reasons, kids can't deal with too long (or hard) gear ratios, but they can't use gears that are too short either, because this has an effect on riding stability. At Orbea we have identified the gears that kids need at each age, and a gear ratio that suits them all.

The outcome is amazingly effective:

- The gear system is easier to use, which means children can quickly learn to handle it properly.
- The problems caused by inadequate combinations of the front and rear gears are avoided.
- The bike is lighter.

ORBEA MINIPRO GEOMETRY (MX 20 AND 24).

Orbea's MiniPro Geometry is the distinctive feature of the new MXs and their terrific performance. This geometry is particularly compact and oriented to sports performance:

- The rear part is especially short for better traction and climbing capacity. This, together with a kid's low weight, makes an efficient rider-bike complex for a rush or two.
- A well-studied sloping geometry and a slightly shorter bottom bracket provide stability and agility to face downhill slopes in a different way. These bikes have been designed even for more experienced riders who want to handle impossibly difficult off-road descents.
- The starting position and the handling of the bike at a standstill really matter in bikes for kids, and we have studied and improved them. We wanted to make bikes that kids could ride and embark on real adventures ending at dinner time. This is why we also worked on transmission, until we came up with an adequate gear ratio.

ORBEA 2014 / EQUIPMENT / DESIGN

CONCEPT AND FEATURES

DESIGN

FEATURES

HELMETS.

Orbea Design revolves around what we consider our four essential elements in design: bicycle lovers, state-of-the-art technology, the creation process and the trends. The logo we have chosen for Orbea Design explains it perfectly: each of these concepts is a key feature of the way we work.

The design of our helmets is in strict alignment with our design concepts. Therefore, we have taken our inspiration from nature, developing our helmet designs according to a natural concept and organic design. Birds are the species that have best evolved within their environment: the air. They are the true representation of the natural evolution of aerodynamics, and for us, their evolution and adaptation are reflected in our organic wind tunnel.

TC TECHNOLOGY.

We have designed a layer construction technology for our helmets that allows us to optimize our helmet features: appearance, ventilation and compactness.

Each helmet is built with a certain number of layers, and a specific material is chosen for each layer according to its features. The more layers there are, the more the surface area of the helmet can be reduced, thus resulting in improved ventilation and a more compact structure.

This design optimization is achieved exclusively through the combination of shapes, construction technology and materials.

AIR FLOW.

Orbea has created a revolutionary design for its helmets: it directs air flow naturally. When the air hits the helmet, it is directed naturally as a result of its careful design.

In the case of a linear design, the air flow encounters resistance when it hits the helmet's surface, and it therefore heads towards the top part of the helmet.

However, the organic design of our helmets drives the air flow towards the sides of the helmet, so that air flows naturally.

This special design translates into better ventilation and a more compact structure.

In designing this product, we took two aspects into consideration:

- **ES Index** (External Surface Index). The External Surface Index: less surface area means better ventilation and a more attractive esthetic.
- ITP Index (Interal Touch point Index). The Internal Touch Point Index: This represents the surface with the points of contact between the helmet and the cyclist's head

Less surface area results in improved ventilation.

RETENTION SYSTEM.

All the Orbea helmets restraint systems can be used with one hand only.

This is a big improvement in terms of security allowing the rider to hold the handlebar with the other hand.

The system is super comfortable due its milimetric head pressure adjustment.

ORBEA PADDING.

The helmet pads are made in Coolmax and max. perspiration mesh.

There are different thickness pads for some models.

ORBEA IN MOLD.

The Orbea helmets are made using an in mold technology.

All the layers and materials are injected in one single process, getting as result a more compact structure and better finish detail.

This allows us to avoid the collage of the policarbonate sheet on the entry level helmets.

CHOOSE YOUR HELMETS

ADJUSTING HELMET STRAPS.

Adjust the fit ring. Buckle and tighten to your neck. The two straps should form a 'V' shape under and slightly in front of the ears. Buckle the chin strap. The helmet should sit level on your head, one or two finger widths above your eyebrows.

CHECKING FIT.

To check the right fit, try to move your helmet from side to side, backward and forward. If it rocks 1 cm or over, adjust the ring. When you turn your head, the helmet should move along.

CHOOSING HELMET SIZE.

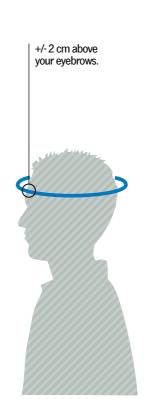

The best way to measure your head circumference is wrapping a flexible measuring tape around it.

DESIGN

FEATURES

CYCLING APPAREL.

Pedaling along 200km, in cold or heat, on flat or steep terrain... You can't leave it to improvisation. That's why our garments are based on an uncompromising philosophy and design. We use cutting-edge technology and sophisticated FABRICS that help riders train and compete at the highest level. Temperature control FABRICS keep your body temperature constant, maximizing performance at any level of intensity.

TECHNOLOGY.

The Orbea PERFORMANCE RMT1 chamois has dramatically changed the concept of ergonomic clothes and rider comfort. This was possible thanks to a 3D structure, plus varying degrees of thickness and density for different paddings.

RACING.

Rider profile

Committed rider, intermediate to advanced level (competition and training).

Rides per week: 3 to 6

Padding

1 multi-thickness 11mm layer, with density 100kg/cm3.

Shape

3D relief cutting technology for unpressed open-cell foam (highly breathable and elastic).

FEATURES

- Fabric made of carbon fibers for better breathability, temperature regulation, antibacterial properties and high performance.
- Fabric designed to prevent skin irritation and sores, and to improve moisture transfer.
- Stretch fabric designed to give more freedom of MOVEMENT.
- \bullet Pre-formed seamless chamois with $90^{\rm o}$ bent wings for maximum comfort.
- Two-level thickness, IMPACT 8 and IMPACT 10. Best vibration absorption and maximum comfort in areas under high pressure.
- Padding dimension. Bigger support area for greater comfort, taking different anatomical positions of sit bones into consideration.

SPORT.

Rider profile

Beginner to intermediate level; long outings.

Rides per week: 1 to 4

Padding

1 multi-thickness 12mm layer.

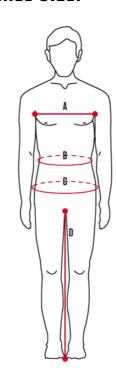

Shape

3D relief cutting technology for unpressed open-cell foam (highly breathable and elastic).

FEATURES

- External antibacterial fabric.
- Fabric designed to prevent skin irritation and sores.
- IMPACT 7 padding. Good vibration absorption and maximum comfort in areas under high pressure.

CAPACITY	2+2L (4L), 10+2L (12L)
ORBEA VALUES	Orbea Design
TECHNOLOGY	Materials, features and functions fit for racing

During exercise you must keep hydrated for good performance, because your fluid losses increase.

Staying hydrated, thus, is essential for good health.

The Hydra hydration packs encourage you to drink consistently for improved sports performance.

FEATURES

MATERIALS.

The Hydra packs are made mainly with polyester and nylon. A careful selection of the diverse variants of these materials results in waterproof, breathable and light products.

BREATHABLE.

The Hydra packs carry special, high-quality breathable and fast-dry fabrics in the areas where they come in contact with your body.

The Air Flow System (AFS) technology is designed for the heat to escape via the central air channel and prevents sweat from staying on the user's body.

WATERPROOF.

The materials of the Hydra packs protect the main compartment from getting wet, which means the things you carry in it won't get damaged.

The rain cover comes in handy in bad weather, protecting your stuff, offering improved visibility and making cleaning and maintenance easier.

ERGONOMICS.

The Hydra packs are anatomically crafted to fit your natural position and offer more comfort and easier access to the main compartment.

They have three fastening points in the back, chest and waist for better fit and comfort during exercise.

FUNCTIONAL.

The pockets in the Orbea Hydra packs can be accessed while riding. There's a pocket separate from the hydration reservoir. In it you can carry everything you need to do sports. There's also a pocket to carry tools, and two more side pockets for small things. The 10+2L pack features a fifth pocket to store electronic devices such as a mobile phone or a GPS, and has a headphone exit port.

- · Magnetic fasteners to hold the anti-leak valve and tube.
- · Straps to hold helmet and sticks.
- · Rain cover and safety whistle.
- \cdot Extra pockets for trash, sunglasses and cellphone; exit port for headphones.
- · Reflective strips.

"The Hydra hydration packs encourage you to drink consistently for improved sports performance."

LIGHTWEIGHT.

We've used ultralight materials to create a hydration solution for greater comfort during outdoor activity.

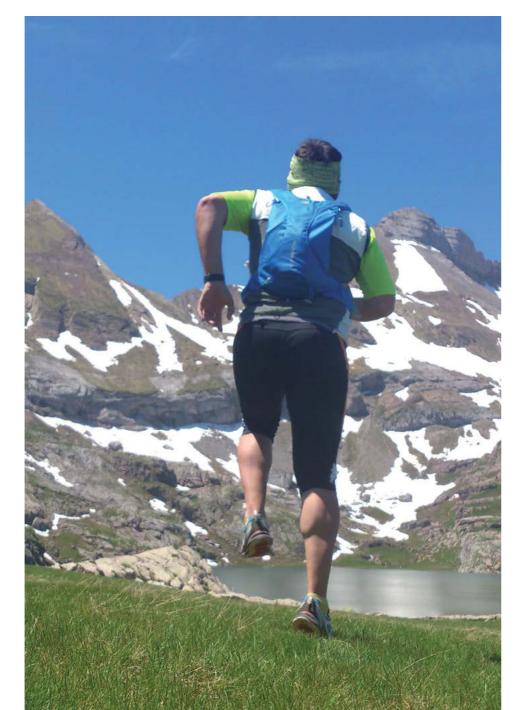

GOOD FOR COMPETITION.

Orbea is competition, and Hydra is no exception. Our backpacks can face any racing challenge you take up. The reservoir has a thermal case, a whistle and a label with mountain safety information.

VOLUME.

2+2L pack with six compartments and interior organizer.

10+2L pack with five compartments and interior organizer.

MAINTENANCE AND CLEANING TIPS.

- · Hand wash at 30°.
- · No bleaching.
- · No ironing.
- · No tumble drying.

Maintenance

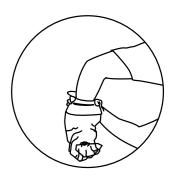

The hydration reservoir needs cleaning and drying for proper maintenance. The reversible reservoir flips completely inside out, making it easy to clean and dry. Follow these six simple steps to clean and dry the reservoir:

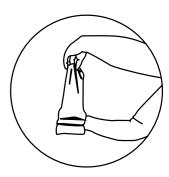

- 1. Unzip and throw away the fluid inside the reservoir.
- **2.** Put your hand into the reservoir right to the bottom and turn it inside out.
- 3. Wash with warm water and soap to remove all dirt.
- 4. Rinse.
- 5. Leave to dry completely.
- **6.** Return the reservoir to the initial shape and get it ready for your next outing.

Clean tube with warm water.

ORBEA
